0	Introduction.....	xiv
0.1	Prologue.....	xiv
0.2	Purpose.....	xiv
0.3	Applications.....	xiv
0.4	Publication and versions of this International Standard.....	xiv
0.5	Profiles and levels.....	xv
0.6	Overview of the design characteristics.....	xv
0.6.1	Predictive coding.....	xv
0.6.2	Coding of progressive and interlaced video.....	xvi
0.6.3	Picture partitioning into macroblocks and smaller partitions.....	xvi
0.6.4	Spatial redundancy reduction.....	xvi
0.7	How to read this specification.....	xvi
1	Scope.....	1
2	Normative references.....	1
3	Definitions.....	1
4	Abbreviations.....	9
5	Conventions.....	10
5.1	Arithmetic operators.....	10
5.2	Logical operators.....	10
5.3	Relational operators.....	11
5.4	Bit-wise operators.....	11
5.5	Assignment operators.....	11
5.6	Range notation.....	11
5.7	Mathematical functions.....	11
5.8	Variables, syntax elements, and tables.....	12
5.9	Text description of logical operations.....	13
5.10	Processes.....	14
6	Source, coded, decoded and output data formats, scanning processes, and neighbouring relationships.....	14
6.1	Bitstream formats.....	14
6.2	Source, decoded, and output picture formats.....	15
6.3	Spatial subdivision of pictures and slices.....	20
6.4	Inverse scanning processes and derivation processes for neighbours.....	20
6.4.1	Inverse macroblock scanning process.....	21
6.4.2	Inverse macroblock partition and sub-macroblock partition scanning process.....	21
6.4.2.1	Inverse macroblock partition scanning process.....	22
6.4.2.2	Inverse sub-macroblock partition scanning process.....	22
6.4.3	Inverse 4x4 luma block scanning process.....	23
6.4.4	Inverse 8x8 luma block scanning process.....	23
6.4.5	Derivation process of the availability for macroblock addresses.....	23
6.4.6	Derivation process for neighbouring macroblock addresses and their availability.....	24
6.4.7	Derivation process for neighbouring macroblock addresses and their availability in MBAFF frames.....	24
6.4.8	Derivation processes for neighbouring macroblocks, blocks, and partitions.....	25
6.4.8.1	Derivation process for neighbouring macroblocks.....	26
6.4.8.2	Derivation process for neighbouring 8x8 luma block.....	26
6.4.8.3	Derivation process for neighbouring 4x4 luma blocks.....	27
6.4.8.4	Derivation process for neighbouring 4x4 chroma blocks.....	28
6.4.8.5	Derivation process for neighbouring partitions.....	28
6.4.9	Derivation process for neighbouring locations.....	30
6.4.9.1	Specification for neighbouring locations in fields and non-MBAFF frames.....	30
6.4.9.2	Specification for neighbouring locations in MBAFF frames.....	31

7	Syntax and semantics	33
7.1	Method of describing syntax in tabular form	33
7.2	Specification of syntax functions, categories, and descriptors	34
7.3	Syntax in tabular form	36
7.3.1	NAL unit syntax	36
7.3.2	Raw byte sequence payloads and RBSP trailing bits syntax	37
7.3.2.1	Sequence parameter set RBSP syntax	37
7.3.2.1.1	Scaling list syntax	38
7.3.2.1.2	Sequence parameter set extension RBSP syntax	39
7.3.2.2	Picture parameter set RBSP syntax	39
7.3.2.3	Supplemental enhancement information RBSP syntax	40
7.3.2.3.1	Supplemental enhancement information message syntax	41
7.3.2.4	Access unit delimiter RBSP syntax	41
7.3.2.5	End of sequence RBSP syntax	41
7.3.2.6	End of stream RBSP syntax	41
7.3.2.7	Filler data RBSP syntax	42
7.3.2.8	Slice layer without partitioning RBSP syntax	42
7.3.2.9	Slice data partition RBSP syntax	42
7.3.2.9.1	Slice data partition A RBSP syntax	42
7.3.2.9.2	Slice data partition B RBSP syntax	42
7.3.2.9.3	Slice data partition C RBSP syntax	43
7.3.2.10	RBSP slice trailing bits syntax	43
7.3.2.11	RBSP trailing bits syntax	43
7.3.3	Slice header syntax	44
7.3.3.1	Reference picture list reordering syntax	45
7.3.3.2	Prediction weight table syntax	46
7.3.3.3	Decoded reference picture marking syntax	47
7.3.4	Slice data syntax	48
7.3.5	Macroblock layer syntax	49
7.3.5.1	Macroblock prediction syntax	50
7.3.5.2	Sub-macroblock prediction syntax	51
7.3.5.3	Residual data syntax	52
7.3.5.3.1	Residual block CAVLC syntax	53
7.3.5.3.2	Residual block CABAC syntax	55
7.4	Semantics	56
7.4.1	NAL unit semantics	56
7.4.1.1	Encapsulation of an SODB within an RBSP (informative)	58
7.4.1.2	Order of NAL units and association to coded pictures, access units, and video sequences	59
7.4.1.2.1	Order of sequence and picture parameter set RBSPs and their activation	59
7.4.1.2.2	Order of access units and association to coded video sequences	60
7.4.1.2.3	Order of NAL units and coded pictures and association to access units	61
7.4.1.2.4	Detection of the first VCL NAL unit of a primary coded picture	62
7.4.1.2.5	Order of VCL NAL units and association to coded pictures	63
7.4.2	Raw byte sequence payloads and RBSP trailing bits semantics	63
7.4.2.1	Sequence parameter set RBSP semantics	63
7.4.2.1.1	Scaling list semantics	68
7.4.2.1.2	Sequence parameter set extension RBSP semantics	69
7.4.2.2	Picture parameter set RBSP semantics	70
7.4.2.3	Supplemental enhancement information RBSP semantics	73
7.4.2.3.1	Supplemental enhancement information message semantics	73
7.4.2.4	Access unit delimiter RBSP semantics	73
7.4.2.5	End of sequence RBSP semantics	73
7.4.2.6	End of stream RBSP semantics	74
7.4.2.7	Filler data RBSP semantics	74
7.4.2.8	Slice layer without partitioning RBSP semantics	74
7.4.2.9	Slice data partition RBSP semantics	74
7.4.2.9.1	Slice data partition A RBSP semantics	74
7.4.2.9.2	Slice data partition B RBSP semantics	74
7.4.2.9.3	Slice data partition C RBSP semantics	74

7.4.2.10	RBSP slice trailing bits semantics	75
7.4.2.11	RBSP trailing bits semantics	75
7.4.3	Slice header semantics	75
7.4.3.1	Reference picture list reordering semantics	81
7.4.3.2	Prediction weight table semantics	82
7.4.3.3	Decoded reference picture marking semantics	82
7.4.4	Slice data semantics	85
7.4.5	Macroblock layer semantics	86
7.4.5.1	Macroblock prediction semantics	93
7.4.5.2	Sub-macroblock prediction semantics	94
7.4.5.3	Residual data semantics	96
7.4.5.3.1	Residual block CAVLC semantics	97
7.4.5.3.2	Residual block CABAC semantics	97
8	Decoding process	98
8.1	NAL unit decoding process	99
8.2	Slice decoding process	99
8.2.1	Decoding process for picture order count	99
8.2.1.1	Decoding process for picture order count type 0	101
8.2.1.2	Decoding process for picture order count type 1	102
8.2.1.3	Decoding process for picture order count type 2	103
8.2.2	Decoding process for macroblock to slice group map	104
8.2.2.1	Specification for interleaved slice group map type	105
8.2.2.2	Specification for dispersed slice group map type	105
8.2.2.3	Specification for foreground with left-over slice group map type	105
8.2.2.4	Specification for box-out slice group map types	106
8.2.2.5	Specification for raster scan slice group map types	106
8.2.2.6	Specification for wipe slice group map types	106
8.2.2.7	Specification for explicit slice group map type	107
8.2.2.8	Specification for conversion of map unit to slice group map to macroblock to slice group map	107
8.2.3	Decoding process for slice data partitioning	107
8.2.4	Decoding process for reference picture lists construction	108
8.2.4.1	Decoding process for picture numbers	108
8.2.4.2	Initialisation process for reference picture lists	109
8.2.4.2.1	Initialisation process for the reference picture list for P and SP slices in frames	109
8.2.4.2.2	Initialisation process for the reference picture list for P and SP slices in fields	110
8.2.4.2.3	Initialisation process for reference picture lists for B slices in frames	110
8.2.4.2.4	Initialisation process for reference picture lists for B slices in fields	111
8.2.4.2.5	Initialisation process for reference picture lists in fields	112
8.2.4.3	Reordering process for reference picture lists	113
8.2.4.3.1	Reordering process of reference picture lists for short-term reference pictures	113
8.2.4.3.2	Reordering process of reference picture lists for long-term reference pictures	114
8.2.5	Decoded reference picture marking process	114
8.2.5.1	Sequence of operations for decoded reference picture marking process	115
8.2.5.2	Decoding process for gaps in frame_num	115
8.2.5.3	Sliding window decoded reference picture marking process	116
8.2.5.4	Adaptive memory control decoded reference picture marking process	116
8.2.5.4.1	Marking process of a short-term reference picture as “unused for reference”	116
8.2.5.4.2	Marking process of a long-term reference picture as “unused for reference”	117
8.2.5.4.3	Assignment process of a LongTermFrameIdx to a short-term reference picture	117
8.2.5.4.4	Decoding process for MaxLongTermFrameIdx	117
8.2.5.4.5	Marking process of all reference pictures as “unused for reference” and setting MaxLongTermFrameIdx to “no long-term frame indices”	118
8.2.5.4.6	Process for assigning a long-term frame index to the current picture	118
8.3	Intra prediction process	118
8.3.1	Intra_4x4 prediction process for luma samples	119
8.3.1.1	Derivation process for the Intra4x4PredMode	119
8.3.1.2	Intra_4x4 sample prediction	121
8.3.1.2.1	Specification of Intra_4x4_Verical prediction mode	122
8.3.1.2.2	Specification of Intra_4x4_Horizontal prediction mode	122
8.3.1.2.3	Specification of Intra_4x4_DC prediction mode	122

8.3.1.2.4	Specification of Intra_4x4_Diagonal_Down_Left prediction mode	123
8.3.1.2.5	Specification of Intra_4x4_Diagonal_Down_Right prediction mode	123
8.3.1.2.6	Specification of Intra_4x4_Vertical_Right prediction mode	123
8.3.1.2.7	Specification of Intra_4x4_Horizontal_Down prediction mode	124
8.3.1.2.8	Specification of Intra_4x4_Vertical_Left prediction mode	124
8.3.1.2.9	Specification of Intra_4x4_Horizontal_Up prediction mode	124
8.3.2	Intra_8x8 prediction process for luma samples	125
8.3.2.1	Derivation process for Intra8x8PredMode	125
8.3.2.2	Intra_8x8 sample prediction	127
8.3.2.2.1	Reference sample filtering process for Intra_8x8 sample prediction	128
8.3.2.2.2	Specification of Intra_8x8_Vertical prediction mode	129
8.3.2.2.3	Specification of Intra_8x8_Horizontal prediction mode	129
8.3.2.2.4	Specification of Intra_8x8_DC prediction mode	129
8.3.2.2.5	Specification of Intra_8x8_Diagonal_Down_Left prediction mode	130
8.3.2.2.6	Specification of Intra_8x8_Diagonal_Down_Right prediction mode	130
8.3.2.2.7	Specification of Intra_8x8_Vertical_Right prediction mode	130
8.3.2.2.8	Specification of Intra_8x8_Horizontal_Down prediction mode	131
8.3.2.2.9	Specification of Intra_8x8_Vertical_Left prediction mode	131
8.3.2.2.10	Specification of Intra_8x8_Horizontal_Up prediction mode	131
8.3.3	Intra_16x16 prediction process for luma samples	132
8.3.3.1	Specification of Intra_16x16_Vertical prediction mode	133
8.3.3.2	Specification of Intra_16x16_Horizontal prediction mode	133
8.3.3.3	Specification of Intra_16x16_DC prediction mode	133
8.3.3.4	Specification of Intra_16x16_Plane prediction mode	133
8.3.4	Intra prediction process for chroma samples	134
8.3.4.1	Specification of Intra_Chroma_DC prediction mode	134
8.3.4.2	Specification of Intra_Chroma_Horizontal prediction mode	136
8.3.4.3	Specification of Intra_Chroma_Vertical prediction mode	136
8.3.4.4	Specification of Intra_Chroma_Plane prediction mode	136
8.3.5	Sample construction process for I_PCM macroblocks	137
8.4	Inter prediction process	137
8.4.1	Derivation process for motion vector components and reference indices	139
8.4.1.1	Derivation process for luma motion vectors for skipped macroblocks in P and SP slices	140
8.4.1.2	Derivation process for luma motion vectors for B_Skip, B_Direct_16x16, and B_Direct_8x8	141
8.4.1.2.1	Derivation process for the co-located 4x4 sub-macroblock partitions	141
8.4.1.2.2	Derivation process for spatial direct luma motion vector and reference index prediction mode	144
8.4.1.2.3	Derivation process for temporal direct luma motion vector and reference index prediction mode	146
8.4.1.3	Derivation process for luma motion vector prediction	148
8.4.1.3.1	Derivation process for median luma motion vector prediction	149
8.4.1.3.2	Derivation process for motion data of neighbouring partitions	150
8.4.1.4	Derivation process for chroma motion vectors	151
8.4.2	Decoding process for Inter prediction samples	151
8.4.2.1	Reference picture selection process	152
8.4.2.2	Fractional sample interpolation process	153
8.4.2.2.1	Luma sample interpolation process	154
8.4.2.2.2	Chroma sample interpolation process	157
8.4.2.3	Weighted sample prediction process	158
8.4.2.3.1	Default weighted sample prediction process	158
8.4.2.3.2	Weighted sample prediction process	159
8.5	Transform coefficient decoding process and picture construction process prior to deblocking filter process ..	161
8.5.1	Specification of transform decoding process for 4x4 luma residual blocks	162
8.5.2	Specification of transform decoding process for luma samples of Intra_16x16 macroblock prediction mode	162
8.5.3	Specification of transform decoding process for 8x8 luma residual blocks	163
8.5.4	Specification of transform decoding process for chroma samples	164
8.5.5	Inverse scanning process for transform coefficients	166
8.5.6	Inverse scanning process for 8x8 luma transform coefficients	167
8.5.7	Derivation process for the chroma quantisation parameters and scaling function	169

8.5.8	Scaling and transformation process for luma DC transform coefficients for Intra_16x16 macroblock type	171
8.5.9	Scaling and transformation process for chroma DC transform coefficients.....	171
8.5.10	Scaling and transformation process for residual 4x4 blocks.....	173
8.5.11	Scaling and transformation process for residual 8x8 luma blocks.....	175
8.5.12	Picture construction process prior to deblocking filter process.....	178
8.5.13	Residual colour transform process.....	179
8.6	Decoding process for P macroblocks in SP slices or SI macroblocks.....	179
8.6.1	SP decoding process for non-switching pictures.....	180
8.6.1.1	Luma transform coefficient decoding process.....	180
8.6.1.2	Chroma transform coefficient decoding process.....	181
8.6.2	SP and SI slice decoding process for switching pictures.....	182
8.6.2.1	Luma transform coefficient decoding process.....	183
8.6.2.2	Chroma transform coefficient decoding process.....	183
8.7	Deblocking filter process.....	184
8.7.1	Filtering process for block edges.....	188
8.7.2	Filtering process for a set of samples across a horizontal or vertical block edge.....	189
8.7.2.1	Derivation process for the luma content dependent boundary filtering strength.....	190
8.7.2.2	Derivation process for the thresholds for each block edge.....	191
8.7.2.3	Filtering process for edges with bS less than 4.....	193
8.7.2.4	Filtering process for edges for bS equal to 4.....	194
9	Parsing process.....	195
9.1	Parsing process for Exp-Golomb codes.....	195
9.1.1	Mapping process for signed Exp-Golomb codes.....	197
9.1.2	Mapping process for coded block pattern.....	197
9.2	CAVLC parsing process for transform coefficient levels.....	200
9.2.1	Parsing process for total number of transform coefficient levels and trailing ones.....	201
9.2.2	Parsing process for level information.....	205
9.2.2.1	Parsing process for level_prefix.....	206
9.2.3	Parsing process for run information.....	206
9.2.4	Combining level and run information.....	209
9.3	CABAC parsing process for slice data.....	209
9.3.1	Initialisation process.....	210
9.3.1.1	Initialisation process for context variables.....	211
9.3.1.2	Initialisation process for the arithmetic decoding engine.....	222
9.3.2	Binarization process.....	222
9.3.2.1	Unary (U) binarization process.....	224
9.3.2.2	Truncated unary (TU) binarization process.....	224
9.3.2.3	Concatenated unary/ k-th order Exp-Golomb (UEGk) binarization process.....	225
9.3.2.4	Fixed-length (FL) binarization process.....	225
9.3.2.5	Binarization process for macroblock type and sub-macroblock type.....	226
9.3.2.6	Binarization process for coded block pattern.....	229
9.3.2.7	Binarization process for mb_qp_delta.....	229
9.3.3	Decoding process flow.....	230
9.3.3.1	Derivation process for ctxIdx.....	230
9.3.3.1.1	Assignment process of ctxIdxInc using neighbouring syntax elements.....	232
9.3.3.1.1.1	Derivation process of ctxIdxInc for the syntax element mb_skip_flag.....	232
9.3.3.1.1.2	Derivation process of ctxIdxInc for the syntax element mb_field_decoding_flag.....	232
9.3.3.1.1.3	Derivation process of ctxIdxInc for the syntax element mb_type.....	233
9.3.3.1.1.4	Derivation process of ctxIdxInc for the syntax element coded_block_pattern.....	233
9.3.3.1.1.5	Derivation process of ctxIdxInc for the syntax element mb_qp_delta.....	234
9.3.3.1.1.6	Derivation process of ctxIdxInc for the syntax elements ref_idx_l0 and ref_idx_l1.....	234
9.3.3.1.1.7	Derivation process of ctxIdxInc for the syntax elements mvd_l0 and mvd_l1.....	235
9.3.3.1.1.8	Derivation process of ctxIdxInc for the syntax element intra_chroma_pred_mode.....	237
9.3.3.1.1.9	Derivation process of ctxIdxInc for the syntax element coded_block_flag.....	237
9.3.3.1.1.10	Derivation process of ctxIdxInc for the syntax element transform_size_8x8_flag.....	238
9.3.3.1.2	Assignment process of ctxIdxInc using prior decoded bin values.....	239
9.3.3.1.3	Assignment process of ctxIdxInc for syntax elements significant_coeff_flag, last_significant_coeff_flag, and coeff_abs_level_minus1.....	239
9.3.3.2	Arithmetic decoding process.....	242

9.3.3.2.1	Arithmetic decoding process for a binary decision	243
9.3.3.2.1.1	State transition process	243
9.3.3.2.2	Renormalization process in the arithmetic decoding engine	246
9.3.3.2.3	Bypass decoding process for binary decisions	247
9.3.3.2.4	Decoding process for binary decisions before termination	247
9.3.4	Arithmetic encoding process (informative)	248
9.3.4.1	Initialisation process for the arithmetic encoding engine (informative)	248
9.3.4.2	Encoding process for a binary decision (informative)	248
9.3.4.3	Renormalization process in the arithmetic encoding engine (informative)	249
9.3.4.4	Bypass encoding process for binary decisions (informative)	251
9.3.4.5	Encoding process for a binary decision before termination (informative)	252
9.3.4.6	Byte stuffing process (informative)	254
Annex A	Profiles and levels	255
A.1	Requirements on video decoder capability	255
A.2	Profiles	255
A.2.1	Baseline profile	255
A.2.2	Main profile	256
A.2.3	Extended profile	256
A.2.4	High profile	256
A.2.5	High 10 profile	257
A.2.6	High 4:2:2 profile	257
A.2.7	High 4:4:4 profile	258
A.3	Levels	258
A.3.1	Level limits common to the Baseline, Main, and Extended profiles	258
A.3.2	Level limits common to the High, High 10, High 4:2:2, and High 4:4:4 profiles	260
A.3.3	Profile-specific level limits	261
A.3.3.1	Baseline profile limits	262
A.3.3.2	Main, High, High 10, High 4:2:2, or High 4:4:4 profile limits	263
A.3.3.3	Extended Profile Limits	264
A.3.4	Effect of level limits on frame rate (informative)	266
Annex B	Byte stream format	269
B.1	Byte stream NAL unit syntax and semantics	269
B.1.1	Byte stream NAL unit syntax	269
B.1.2	Byte stream NAL unit semantics	269
B.2	Byte stream NAL unit decoding process	270
B.3	Decoder byte-alignment recovery (informative)	270
Annex C	Hypothetical reference decoder	272
C.1	Operation of coded picture buffer (CPB)	274
C.1.1	Timing of bitstream arrival	274
C.1.2	Timing of coded picture removal	275
C.2	Operation of the decoded picture buffer (DPB)	276
C.2.1	Decoding of gaps in frame_num and storage of "non-existing" frames	276
C.2.2	Picture decoding and output	276
C.2.3	Removal of pictures from the DPB before possible insertion of the current picture	277
C.2.4	Current decoded picture marking and storage	277
C.2.4.1	Marking and storage of a reference decoded picture into the DPB	277
C.2.4.2	Storage of a non-reference picture into the DPB	277
C.3	Bitstream conformance	277
C.4	Decoder conformance	279
C.4.1	Operation of the output order DPB	280
C.4.2	Decoding of gaps in frame_num and storage of "non-existing" pictures	280
C.4.3	Picture decoding	280
C.4.4	Removal of pictures from the DPB before possible insertion of the current picture	280
C.4.5	Current decoded picture marking and storage	281
C.4.5.1	Storage and marking of a reference decoded picture into the DPB	281
C.4.5.2	Storage and marking of a non-reference decoded picture into the DPB	281
C.4.5.3	"Bumping" process	281

Annex D Supplemental enhancement information	283
D.1 SEI payload syntax	284
D.1.1 Buffering period SEI message syntax	285
D.1.2 Picture timing SEI message syntax	285
D.1.3 Pan-scan rectangle SEI message syntax	286
D.1.4 Filler payload SEI message syntax	287
D.1.5 User data registered by ITU-T Recommendation T.35 SEI message syntax	287

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 14496-10 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information Technology*, Subcommittee SC 29, *Coding of Audio, Picture, Multimedia and Hypermedia Information*.

This third edition cancels and replaces the second edition (ISO/IEC 14496-10:2004), which has been technically revised.

This part of ISO/IEC 14496 is technically aligned with ITU-T Rec. H.264 but is not published as identical text.

ISO/IEC 14496 consists of the following parts, under the general title *Information technology — Coding of audio-visual objects*:

- *Part 1: Systems*
- *Part 2: Visual*
- *Part 3: Audio*
- *Part 4: Conformance testing*
- *Part 5: Reference software*
- *Part 6: Delivery Multimedia Integration Framework (DMIF)*
- *Part 7: Optimized reference software for coding of audio-visual objects* [Technical Report]
- *Part 8: Carriage of ISO/IEC 14496 contents over IP networks*
- *Part 9: Reference hardware description* [Technical Report]
- *Part 10: Advanced Video Coding*
- *Part 11: Scene description and application engine*
- *Part 12: ISO base media file format*
- *Part 13: Intellectual Property Management and Protection (IPMP) extensions*
- *Part 14: MP4 file format*

- *Part 15: Advanced Video Coding (AVC) file format*
- *Part 16: Animation Framework eXtension (AFX)*
- *Part 17: Streaming text format*
- *Part 18: Font compression and streaming*
- *Part 19: Synthesized texture stream*
- *Part 20: Lightweight Application Scene Representation (LSeR) and Simple Aggregation Format (SAF)*

The following parts are under preparation:

- *Part 21: MPEG-J GFX*

This corrected version of ISO/IEC 14496-10:2005(E) incorporates the following corrections:

- On the cover, the words “Second edition” have been replaced by the words “Third edition”.
- In 6.4.4, Figure 6-11 has been replaced.
- The last sentence of 7.1 has been replaced by the following: “When **syntax_element** appears, it specifies that a syntax element is parsed from the bitstream and the bitstream pointer is advanced to the next position beyond the syntax element in the bitstream parsing process.”
- In 8.4.1.3, Figure 8-1 has been renumbered as Figure 8-3.
- In 8.4.2.2.1, Figure 8-2 has been renumbered as Figure 8-4.
- In D.2.20, Equation D-15, “film_grain_bit_depth_luma_minus8” has been changed to “film_grain_bit_depth_chroma_minus8”.
- In Table F-1, the heading “Notices filed and included in version 1” has been changed to “Notices filed and included in version 1. Version 1 corresponds to ISO/IEC 14496-10:2003.”

0 Introduction

This clause does not form an integral part of this Recommendation | International Standard.

0.1 Prologue

This subclause does not form an integral part of this Recommendation | International Standard.

As the costs for both processing power and memory have reduced, network support for coded video data has diversified, and advances in video coding technology have progressed, the need has arisen for an industry standard for compressed video representation with substantially increased coding efficiency and enhanced robustness to network environments. Toward these ends the ITU-T Video Coding Experts Group (VCEG) and the ISO/IEC Moving Picture Experts Group (MPEG) formed a Joint Video Team (JVT) in 2001 for development of a new Recommendation | International Standard.

0.2 Purpose

This subclause does not form an integral part of this Recommendation | International Standard.

This Recommendation | International Standard was developed in response to the growing need for higher compression of moving pictures for various applications such as videoconferencing, digital storage media, television broadcasting, internet streaming, and communication. It is also designed to enable the use of the coded video representation in a flexible manner for a wide variety of network environments. The use of this Recommendation | International Standard allows motion video to be manipulated as a form of computer data and to be stored on various storage media, transmitted and received over existing and future networks and distributed on existing and future broadcasting channels.

0.3 Applications

This subclause does not form an integral part of this Recommendation | International Standard.

This Recommendation | International Standard is designed to cover a broad range of applications for video content including but not limited to the following:

CATV	Cable TV on optical networks, copper, etc.
DBS	Direct broadcast satellite video services
DSL	Digital subscriber line video services
DTTB	Digital terrestrial television broadcasting
ISM	Interactive storage media (optical disks, etc.)
MMM	Multimedia mailing
MSPN	Multimedia services over packet networks
RTC	Real-time conversational services (videoconferencing, videophone, etc.)
RVS	Remote video surveillance
SSM	Serial storage media (digital VTR, etc.)

0.4 Publication and versions of this International Standard

This subclause does not form an integral part of this Recommendation | International Standard.

This International Standard has been jointly developed by ITU-T Video Coding Experts Group (VCEG) and the ISO/IEC Moving Picture Experts Group. It is published as technically-aligned twin text in both organizations ITU-T and ISO/IEC.

ITU-T Rec. H.264 | ISO/IEC 14496-10 version 1 refers to the first (2003) approved version of this Recommendation | International Standard.

ITU-T Rec. H.264 | ISO/IEC 14496-10 version 2 refers to the integrated text containing the corrections specified in the first technical corrigendum.

ITU-T Rec. H.264 | ISO/IEC 14496-10 version 3 refers to the integrated text containing both the first technical corrigendum (2004) and the first amendment, which is referred to as the "Fidelity range extensions".

ITU-T Rec. H.264 | ISO/IEC 14496-10 version 4 (the current specification) refers to the integrated text containing the first technical corrigendum (2004), the first amendment (the "Fidelity range extensions"), and an additional technical corrigendum (2005). In the ITU-T, the next published version after version 2 was version 4 (due to the completion of the drafting work for version 4 prior to the approval opportunity for a final version 3 text).

0.5 Profiles and levels

This subclause does not form an integral part of this Recommendation | International Standard.

This Recommendation | International Standard is designed to be generic in the sense that it serves a wide range of applications, bit rates, resolutions, qualities, and services. Applications should cover, among other things, digital storage media, television broadcasting and real-time communications. In the course of creating this International Standard, various requirements from typical applications have been considered, necessary algorithmic elements have been developed, and these have been integrated into a single syntax. Hence, this International Standard will facilitate video data interchange among different applications.

Considering the practicality of implementing the full syntax of this International Standard, however, a limited number of subsets of the syntax are also stipulated by means of "profiles" and "levels". These and other related terms are formally defined in clause 3.

A "profile" is a subset of the entire bitstream syntax that is specified by this Recommendation | International Standard. Within the bounds imposed by the syntax of a given profile it is still possible to require a very large variation in the performance of encoders and decoders depending upon the values taken by syntax elements in the bitstream such as the specified size of the decoded pictures. In many applications, it is currently neither practical nor economic to implement a decoder capable of dealing with all hypothetical uses of the syntax within a particular profile.

In order to deal with this problem, "levels" are specified within each profile. A level is a specified set of constraints imposed on values of the syntax elements in the bitstream. These constraints may be simple limits on values. Alternatively they may take the form of constraints on arithmetic combinations of values (e.g. picture width multiplied by picture height multiplied by number of pictures decoded per second).

Coded video content conforming to this Recommendation | International Standard uses a common syntax. In order to achieve a subset of the complete syntax, flags, parameters, and other syntax elements are included in the bitstream that signal the presence or absence of syntactic elements that occur later in the bitstream.

0.6 Overview of the design characteristics

This subclause does not form an integral part of this Recommendation | International Standard.

The coded representation specified in the syntax is designed to enable a high compression capability for a desired image quality. With the exception of the transform bypass mode of operation for lossless coding in the High 4:4:4 profile and the I_PCM mode of operation in all profiles, the algorithm is typically not lossless, as the exact source sample values are typically not preserved through the encoding and decoding processes. A number of techniques may be used to achieve highly efficient compression. Encoding algorithms (not specified in this Recommendation | International Standard) may select between inter and intra coding for block-shaped regions of each picture. Inter coding uses motion vectors for block-based inter prediction to exploit temporal statistical dependencies between different pictures. Intra coding uses various spatial prediction modes to exploit spatial statistical dependencies in the source signal for a single picture. Motion vectors and intra prediction modes may be specified for a variety of block sizes in the picture. The prediction residual is then further compressed using a transform to remove spatial correlation inside the transform block before it is quantised, producing an irreversible process that typically discards less important visual information while forming a close approximation to the source samples. Finally, the motion vectors or intra prediction modes are combined with the quantised transform coefficient information and encoded using either variable length codes or arithmetic coding.

0.6.1 Predictive coding

This subclause does not form an integral part of this Recommendation | International Standard.

Because of the conflicting requirements of random access and highly efficient compression, two main coding types are specified. Intra coding is done without reference to other pictures. Intra coding may provide access points to the coded sequence where decoding can begin and continue correctly, but typically also shows only moderate compression efficiency. Inter coding (predictive or bi-predictive) is more efficient using inter prediction of each block of sample values from some previously decoded picture selected by the encoder. In contrast to some other video coding standards, pictures coded using bi-predictive inter prediction may also be used as references for inter coding of other pictures.

The application of the three coding types to pictures in a sequence is flexible, and the order of the decoding process is generally not the same as the order of the source picture capture process in the encoder or the output order from the decoder for display. The choice is left to the encoder and will depend on the requirements of the application. The decoding order is specified such that the decoding of pictures that use inter-picture prediction follows later in decoding order than other pictures that are referenced in the decoding process.

0.6.2 Coding of progressive and interlaced video

This subclause does not form an integral part of this Recommendation | International Standard.

This Recommendation | International Standard specifies a syntax and decoding process for video that originated in either progressive-scan or interlaced-scan form, which may be mixed together in the same sequence. The two fields of an interlaced frame are separated in capture time while the two fields of a progressive frame share the same capture time. Each field may be coded separately or the two fields may be coded together as a frame. Progressive frames are typically coded as a frame. For interlaced video, the encoder can choose between frame coding and field coding. Frame coding or field coding can be adaptively selected on a picture-by-picture basis and also on a more localized basis within a coded frame. Frame coding is typically preferred when the video scene contains significant detail with limited motion. Field coding typically works better when there is fast picture-to-picture motion.

0.6.3 Picture partitioning into macroblocks and smaller partitions

This subclause does not form an integral part of this Recommendation | International Standard.

As in previous video coding Recommendations and International Standards, a macroblock, consisting of a 16x16 block of luma samples and two corresponding blocks of chroma samples, is used as the basic processing unit of the video decoding process.

A macroblock can be further partitioned for inter prediction. The selection of the size of inter prediction partitions is a result of a trade-off between the coding gain provided by using motion compensation with smaller blocks and the quantity of data needed to represent the data for motion compensation. In this Recommendation | International Standard the inter prediction process can form segmentations for motion representation as small as 4x4 luma samples in size, using motion vector accuracy of one-quarter of the luma sample grid spacing displacement. The process for inter prediction of a sample block can also involve the selection of the picture to be used as the reference picture from a number of stored previously-decoded pictures. Motion vectors are encoded differentially with respect to predicted values formed from nearby encoded motion vectors.

Typically, the encoder calculates appropriate motion vectors and other data elements represented in the video data stream. This motion estimation process in the encoder and the selection of whether to use inter prediction for the representation of each region of the video content is not specified in this Recommendation | International Standard.

0.6.4 Spatial redundancy reduction

This subclause does not form an integral part of this Recommendation | International Standard.

Both source pictures and prediction residuals have high spatial redundancy. This Recommendation | International Standard is based on the use of a block-based transform method for spatial redundancy removal. After inter prediction from previously-decoded samples in other pictures or spatial-based prediction from previously-decoded samples within the current picture, the resulting prediction residual is split into 4x4 blocks. These are converted into the transform domain where they are quantised. After quantisation many of the transform coefficients are zero or have low amplitude and can thus be represented with a small amount of encoded data. The processes of transformation and quantisation in the encoder are not specified in this Recommendation | International Standard.

0.7 How to read this specification

This subclause does not form an integral part of this Recommendation | International Standard.

It is suggested that the reader start with Clause 1 (Scope) and moves on to clause 3 (Definitions). Clause 6 should be read for the geometrical relationship of the source, input, and output of the decoder. Clause 7 (Syntax and semantics) specifies the order to parse syntax elements from the bitstream. See subclauses 7.1-7.3 for syntactical order and see subclause 7.4 for semantics; i.e., the scope, restrictions, and conditions that are imposed on the syntax elements. The actual parsing for most syntax elements is specified in Clause 9 (Parsing process). Finally, Clause 8 (Decoding process) specifies how the syntax elements are mapped into decoded samples. Throughout reading this specification, the reader should refer to Clauses 2 (Normative references), 4 (Abbreviations), and 5 (Conventions) as needed. Annexes A through E also form an integral part of this Recommendation | International Standard.

Annex A specifies seven profiles (Baseline, Main, Extended, High, High 10, High 4:2:2 and High 4:4:4), each being tailored to certain application domains, and defines the so-called levels of the profiles. Annex B specifies syntax and semantics of a byte stream format for delivery of coded video as an ordered stream of bytes. Annex C specifies the hypothetical reference decoder and its use to check bitstream and decoder conformance. Annex D specifies syntax and semantics for supplemental enhancement information message payloads. Finally, Annex E specifies syntax and semantics of the video usability information parameters of the sequence parameter set.

Throughout this specification, statements appearing with the preamble "NOTE -" are informative and are not an integral part of this Recommendation | International Standard.

Information technology — Coding of audio-visual objects —

Part 10: Advanced Video Coding

1 Scope

This document specifies ITU-T Recommendation H.264 | ISO/IEC International Standard ISO/IEC 14496-10 video coding.

2 Normative references

The following Recommendations and International Standards contain provisions that, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The Telecommunication Standardisation Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

- ITU-T Recommendation T.35 (2000), *Procedure for the allocation of ITU-T defined codes for non-standard facilities*
- ISO/IEC 11578:1996, *Information technology — Open Systems Interconnection — Remote Procedure Call (RPC)*
- ISO/CIE 10527:1991, *CIE standard colorimetric observers*

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply.

- 3.1 access unit:** A set of *NAL units* always containing exactly one *primary coded picture*. In addition to the *primary coded picture*, an access unit may also contain one or more *redundant coded pictures* or other *NAL units* not containing *slices* or *slice data partitions* of a *coded picture*. The decoding of an access unit always results in a *decoded picture*.
- 3.2 AC transform coefficient:** Any *transform coefficient* for which the *frequency index* in one or both dimensions is non-zero.
- 3.3 adaptive binary arithmetic decoding process:** An *entropy decoding process* that derives the values of *bins* from a *bitstream* produced by an *adaptive binary arithmetic encoding process*.
- 3.4 adaptive binary arithmetic encoding process:** An *entropy encoding process*, not normatively specified in this Recommendation | International Standard, that codes a sequence of *bins* and produces a *bitstream* that can be decoded using the *adaptive binary arithmetic decoding process*.
- 3.5 alpha blending:** A process not specified by this Recommendation | International Standard, in which an *auxiliary coded picture* is used in combination with a *primary coded picture* and with other data not specified by this Recommendation | International Standard in the *display process*. In an alpha blending process, the samples of an *auxiliary coded picture* are interpreted as indications of the degree of opacity (or, equivalently, the degrees of transparency) associated with the corresponding *luma* samples of the *primary coded picture*.

- 3.6 arbitrary slice order:** A *decoding order* of *slices* in which the *macroblock address* of the first *macroblock* of some *slice* of a *picture* may be less than the *macroblock address* of the first *macroblock* of some other preceding *slice* of the same *coded picture*.
- 3.7 auxiliary coded picture:** A *picture* that supplements the *primary coded picture* that may be used in combination with other data not specified by this Recommendation | International Standard in the *display process*. An auxiliary coded picture has the same syntactic and semantic restrictions as a monochrome *redundant coded picture*. An auxiliary coded picture must contain the same number of *macroblocks* as the *primary coded picture*. Auxiliary coded pictures have no normative effect on the *decoding process*. See also *primary coded picture* and *redundant coded picture*.
- 3.8 B slice:** A *slice* that may be decoded using *intra prediction* from decoded samples within the same *slice* or *inter prediction* from previously-decoded *reference pictures*, using at most two *motion vectors* and *reference indices* to *predict* the sample values of each *block*.
- 3.9 bin:** One bit of a *bin string*.
- 3.10 binarization:** A set of *bin strings* for all possible values of a *syntax element*.
- 3.11 binarization process:** A unique mapping process of all possible values of a *syntax element* onto a set of *bin strings*.
- 3.12 bin string:** A string of *bins*. A bin string is an intermediate binary representation of values of *syntax elements* from the *binarization* of the *syntax element*.
- 3.13 bi-predictive slice:** See *B slice*.
- 3.14 bitstream:** A sequence of bits that forms the representation of *coded pictures* and associated data forming one or more *coded video sequences*. Bitstream is a collective term used to refer either to a *NAL unit stream* or a *byte stream*.
- 3.15 block:** An MxN (M-column by N-row) array of samples, or an MxN array of *transform coefficients*.
- 3.16 bottom field:** One of two *fields* that comprise a *frame*. Each row of a *bottom field* is spatially located immediately below a corresponding row of a *top field*.
- 3.17 bottom macroblock (of a macroblock pair):** The *macroblock* within a *macroblock pair* that contains the samples in the bottom row of samples for the *macroblock pair*. For a *field macroblock pair*, the bottom macroblock represents the samples from the region of the *bottom field* of the *frame* that lie within the spatial region of the *macroblock pair*. For a *frame macroblock pair*, the bottom macroblock represents the samples of the *frame* that lie within the bottom half of the spatial region of the *macroblock pair*.
- 3.18 broken link:** A location in a *bitstream* at which it is indicated that some subsequent *pictures* in *decoding order* may contain serious visual artefacts due to unspecified operations performed in the generation of the *bitstream*.
- 3.19 byte:** A sequence of 8 bits, written and read with the most significant bit on the left and the least significant bit on the right. When represented in a sequence of data bits, the most significant bit of a byte is first.
- 3.20 byte-aligned:** A position in a *bitstream* is byte-aligned when the position is an integer multiple of 8 bits from the position of the first bit in the *bitstream*. A bit or *byte* or *syntax element* is said to be byte-aligned when the position at which it appears in a *bitstream* is byte-aligned.
- 3.21 byte stream:** An encapsulation of a *NAL unit stream* containing *start code prefixes* and *NAL units* as specified in Annex B.
- 3.22 can:** A term used to refer to behaviour that is allowed, but not necessarily required.
- 3.23 category:** A number associated with each *syntax element*. The category is used to specify the allocation of *syntax elements* to *NAL units* for *slice data partitioning*. It may also be used in a manner determined by the application to refer to classes of *syntax elements* in a manner not specified in this Recommendation | International Standard.
- 3.24 chroma:** An adjective specifying that a sample array or single sample is representing one of the two colour difference signals related to the primary colours. The symbols used for a chroma array or sample are Cb and Cr.

NOTE - The term chroma is used rather than the term chrominance in order to avoid the implication of the use of linear light transfer characteristics that is often associated with the term chrominance.

- 3.25 coded field:** A coded representation of a field.
- 3.26 coded frame:** A coded representation of a frame.
- 3.27 coded picture:** A coded representation of a picture. A coded picture may be either a coded field or a coded frame. Coded picture is a collective term referring to a primary coded picture or a redundant coded picture, but not to both together.
- 3.28 coded picture buffer (CPB):** A first-in first-out buffer containing access units in decoding order specified in the hypothetical reference decoder in Annex C.
- 3.29 coded representation:** A data element as represented in its coded form.
- 3.30 coded video sequence:** A sequence of access units that consists, in decoding order, of an IDR access unit followed by zero or more non-IDR access units including all subsequent access units up to but not including any subsequent IDR access unit.
- 3.31 component:** An array or single sample from one of the three arrays (luma and two chroma) that make up a field or frame.
- 3.32 complementary field pair:** A collective term for a complementary reference field pair or a complementary non-reference field pair.
- 3.33 complementary non-reference field pair:** Two non-reference fields that are in consecutive access units in decoding order as two coded fields of opposite parity where the first field is not already a paired field.
- 3.34 complementary reference field pair:** Two reference fields that are in consecutive access units in decoding order as two coded fields and share the same value of the frame_num syntax element, where the second field in decoding order is not an IDR picture and does not include a memory_management_control_operation syntax element equal to 5.
- 3.35 context variable:** A variable specified for the adaptive binary arithmetic decoding process of a bin by an equation containing recently decoded bins.
- 3.36 DC transform coefficient:** A transform coefficient for which the frequency index is zero in all dimensions.
- 3.37 decoded picture:** A decoded picture is derived by decoding a coded picture. A decoded picture is either a decoded frame, or a decoded field. A decoded field is either a decoded top field or a decoded bottom field.
- 3.38 decoded picture buffer (DPB):** A buffer holding decoded pictures for reference, output reordering, or output delay specified for the hypothetical reference decoder in Annex C.
- 3.39 decoder:** An embodiment of a decoding process.
- 3.40 decoding order:** The order in which syntax elements are processed by the decoding process.
- 3.41 decoding process:** The process specified in this Recommendation | International Standard that reads a bitstream and derives decoded pictures from it.
- 3.42 direct prediction:** An inter prediction for a block for which no motion vector is decoded. Two direct prediction modes are specified that are referred to as spatial direct prediction and temporal prediction mode.
- 3.43 display process:** A process not specified in this Recommendation | International Standard having, as its input, the cropped decoded pictures that are the output of the decoding process.
- 3.44 decoder under test (DUT):** A decoder that is tested for conformance to this Recommendation | International Standard by operating the hypothetical stream scheduler to deliver a conforming bitstream to the decoder and to the hypothetical reference decoder and comparing the values and timing of the output of the two decoders.
- 3.45 emulation prevention byte:** A byte equal to 0x03 that may be present within a NAL unit. The presence of emulation prevention bytes ensures that no sequence of consecutive byte-aligned bytes in the NAL unit contains a start code prefix.
- 3.46 encoder:** An embodiment of an encoding process.
- 3.47 encoding process:** A process, not specified in this Recommendation | International Standard, that produces a bitstream conforming to this Recommendation | International Standard.

- 3.48 field:** An assembly of alternate rows of a *frame*. A *frame* is composed of two *fields*, a *top field* and a *bottom field*.
- 3.49 field macroblock:** A macroblock containing samples from a single *field*. All *macroblocks* of a *coded field* are field macroblocks. When *macroblock-adaptive frame/field decoding* is in use, some *macroblocks* of a *coded frame* may be field macroblocks.
- 3.50 field macroblock pair:** A *macroblock pair* decoded as two *field macroblocks*.
- 3.51 field scan:** A specific sequential ordering of *transform coefficients* that differs from the *zig-zag scan* by scanning columns more rapidly than rows. Field scan is used for *transform coefficients* in *field macroblocks*.
- 3.52 flag:** A variable that can take one of the two possible values 0 and 1.
- 3.53 frame:** A *frame* contains an array of *luma* samples and two corresponding arrays of *chroma* samples. A *frame* consists of two *fields*, a *top field* and a *bottom field*.
- 3.54 frame macroblock:** A *macroblock* representing samples from the two *fields* of a *coded frame*. When *macroblock-adaptive frame/field decoding* is not in use, all *macroblocks* of a *coded frame* are frame macroblocks. When *macroblock-adaptive frame/field decoding* is in use, some *macroblocks* of a *coded frame* may be frame macroblocks.
- 3.55 frame macroblock pair:** A *macroblock pair* decoded as two *frame macroblocks*.
- 3.56 frequency index:** A one-dimensional or two-dimensional index associated with a *transform coefficient* prior to an *inverse transform* part of the *decoding process*.
- 3.57 hypothetical reference decoder (HRD):** A hypothetical *decoder* model that specifies constraints on the variability of conforming *NAL unit streams* or conforming *byte streams* that an encoding process may produce.
- 3.58 hypothetical stream scheduler (HSS):** A hypothetical delivery mechanism for the timing and data flow of the input of a *bitstream* into the *hypothetical reference decoder*. The HSS is used for checking the conformance of a *bitstream* or a *decoder*.
- 3.59 I slice:** A *slice* that is not an *SI slice* that is decoded using *prediction* only from decoded samples within the same *slice*.
- 3.60 informative:** A term used to refer to content provided in this Recommendation | International Standard that is not an integral part of this Recommendation | International Standard. Informative content does not establish any mandatory requirements for conformance to this Recommendation | International Standard.
- 3.61 instantaneous decoding refresh (IDR) access unit:** An *access unit* in which the *primary coded picture* is an *IDR picture*.
- 3.62 instantaneous decoding refresh (IDR) picture:** A *coded picture* in which all *slices* are *I* or *SI slices* that causes the *decoding process* to mark all *reference pictures* as "unused for reference" immediately after decoding the *IDR picture*. After the decoding of an *IDR picture* all following *coded pictures* in *decoding order* can be decoded without *inter prediction* from any *picture* decoded prior to the *IDR picture*. The first *picture* of each *coded video sequence* is an *IDR picture*.
- 3.63 inter coding:** Coding of a *block*, *macroblock*, *slice*, or *picture* that uses *inter prediction*.
- 3.64 inter prediction:** A *prediction* derived from decoded samples of *reference pictures* other than the current *decoded picture*.
- 3.65 interpretation sample value:** A possibly-altered value corresponding to a decoded sample value of an *auxiliary coded picture* that may be generated for use in the *display process*. Interpretation sample values are not used in the *decoding process* and have no normative effect on the *decoding process*.
- 3.66 intra coding:** Coding of a *block*, *macroblock*, *slice*, or *picture* that uses *intra prediction*.
- 3.67 intra prediction:** A *prediction* derived from the decoded samples of the same decoded *slice*.
- 3.68 intra slice:** See *I slice*.
- 3.69 inverse transform:** A part of the *decoding process* by which a set of *transform coefficients* are converted into spatial-domain values, or by which a set of *transform coefficients* are converted into *DC transform coefficients*.

- 3.70 layer:** One of a set of syntactical structures in a non-branching hierarchical relationship. Higher layers contain lower layers. The coding layers are the *coded video sequence*, *picture*, *slice*, and *macroblock* layers.
- 3.71 level:** A defined set of constraints on the values that may be taken by the *syntax elements* and variables of this Recommendation | International Standard. The same set of levels is defined for all *profiles*, with most aspects of the definition of each level being in common across different *profiles*. Individual implementations may, within specified constraints, support a different level for each supported *profile*. In a different context, level is the value of a *transform coefficient* prior to *scaling*.
- 3.72 list 0 (list 1) motion vector:** A *motion vector* associated with a *reference index* pointing into *reference picture list 0 (list 1)*.
- 3.73 list 0 (list 1) prediction:** *Inter prediction* of the content of a *slice* using a *reference index* pointing into *reference picture list 0 (list 1)*.
- 3.74 luma:** An adjective specifying that a sample array or single sample is representing the monochrome signal related to the primary colours. The symbol or subscript used for luma is Y or L.
NOTE – The term luma is used rather than the term luminance in order to avoid the implication of the use of linear light transfer characteristics that is often associated with the term luminance. The symbol L is sometimes used instead of the symbol Y to avoid confusion with the symbol y as used for vertical location.
- 3.75 macroblock:** A 16x16 *block* of *luma* samples and two corresponding *blocks* of *chroma* samples. The division of a *slice* or a *macroblock pair* into macroblocks is a *partitioning*.
- 3.76 macroblock-adaptive frame/field decoding:** A *decoding process* for *coded frames* in which some *macroblocks* may be decoded as *frame macroblocks* and others may be decoded as *field macroblocks*.
- 3.77 macroblock address:** When *macroblock-adaptive frame/field decoding* is not in use, a macroblock address is the index of a macroblock in a *macroblock raster scan* of the *picture* starting with zero for the top-left macroblock in a *picture*. When *macroblock-adaptive frame/field decoding* is in use, the macroblock address of the top macroblock of a *macroblock pair* is two times the index of the *macroblock pair* in a *macroblock pair raster scan* of the *picture*, and the macroblock address of the bottom macroblock of a *macroblock pair* is the macroblock address of the corresponding top macroblock plus 1. The macroblock address of the top macroblock of each *macroblock pair* is an even number and the macroblock address of the bottom macroblock of each *macroblock pair* is an odd number.
- 3.78 macroblock location:** The two-dimensional coordinates of a *macroblock* in a *picture* denoted by (x, y). For the top left macroblock of the *picture* (x, y) is equal to (0, 0). x is incremented by 1 for each *macroblock* column from left to right. When *macroblock-adaptive frame/field decoding* is not in use, y is incremented by 1 for each *macroblock* row from top to bottom. When *macroblock-adaptive frame/field decoding* is in use, y is incremented by 2 for each *macroblock pair* row from top to bottom, and is incremented by an additional 1 when a macroblock is a *bottom macroblock*.
- 3.79 macroblock pair:** A pair of vertically contiguous *macroblocks* in a *frame* that is coupled for use in *macroblock-adaptive frame/field decoding*. The division of a *slice* into macroblock pairs is a *partitioning*.
- 3.80 macroblock partition:** A *block* of *luma* samples and two corresponding *blocks* of *chroma* samples resulting from a *partitioning* of a *macroblock* for *inter prediction*.
- 3.81 macroblock to slice group map:** A means of mapping *macroblocks* of a *picture* into *slice groups*. The macroblock to slice group map consists of a list of numbers, one for each coded *macroblock*, specifying the *slice group* to which each coded *macroblock* belongs.
- 3.82 map unit to slice group map:** A means of mapping *slice group map units* of a *picture* into *slice groups*. The map unit to slice group map consists of a list of numbers, one for each *slice group map unit*, specifying the *slice group* to which each coded *slice group map unit* belongs.
- 3.83 may:** A term used to refer to behaviour that is allowed, but not necessarily required. In some places where the optional nature of the described behaviour is intended to be emphasized, the phrase "may or may not" is used to provide emphasis.
- 3.84 memory management control operation:** Seven operations that control *reference picture marking*.
- 3.85 motion vector:** A two-dimensional vector used for *inter prediction* that provides an offset from the coordinates in the *decoded picture* to the coordinates in a *reference picture*.

- 3.86 **must**: A term used in expressing an observation about a requirement or an implication of a requirement that is specified elsewhere in this Recommendation | International Standard. This term is used exclusively in an *informative* context.
- 3.87 **NAL unit**: A syntax structure containing an indication of the type of data to follow and *bytes* containing that data in the form of an *RBSP* interspersed as necessary with *emulation prevention bytes*.
- 3.88 **NAL unit stream**: A sequence of *NAL units*.
- 3.89 **non-paired field**: A collective term for a *non-paired reference field* or a *non-paired non-reference field*.
- 3.90 **non-paired non-reference field**: A decoded *non-reference field* that is not part of a *complementary non-reference field pair*.
- 3.91 **non-paired reference field**: A decoded *reference field* that is not part of a *complementary reference field pair*.
- 3.92 **non-reference field**: A *field* coded with *nal_ref_idc* equal to 0.
- 3.93 **non-reference frame**: A *frame* coded with *nal_ref_idc* equal to 0.
- 3.94 **non-reference picture**: A *picture* coded with *nal_ref_idc* equal to 0. A *non-reference picture* is not used for *inter prediction* of any other *pictures*.
- 3.95 **note**: A term used to prefix *informative* remarks. This term is used exclusively in an *informative* context.
- 3.96 **opposite parity**: The *opposite parity* of *top* is *bottom*, and vice versa.
- 3.97 **output order**: The order in which the *decoded pictures* are output from the *decoded picture buffer*.
- 3.98 **P slice**: A *slice* that may be decoded using *intra prediction* from decoded samples within the same *slice* or *inter prediction* from previously-decoded *reference pictures*, using at most one *motion vector* and *reference index* to *predict* the sample values of each *block*.
- 3.99 **parameter**: A *syntax element* of a *sequence parameter set* or a *picture parameter set*. Parameter is also used as part of the defined term *quantisation parameter*.
- 3.100 **parity**: The parity of a *field* can be *top* or *bottom*.
- 3.101 **partitioning**: The division of a set into subsets such that each element of the set is in exactly one of the subsets.
- 3.102 **picture**: A collective term for a *field* or a *frame*.
- 3.103 **picture parameter set**: A *syntax structure* containing *syntax elements* that apply to zero or more entire *coded pictures* as determined by the *pic_parameter_set_id syntax element* found in each *slice header*.
- 3.104 **picture order count**: A variable having a value that is non-decreasing with increasing *picture* position in output order relative to the previous *IDR picture* in *decoding order* or relative to the previous *picture* containing the *memory management control operation* that marks all *reference pictures* as “unused for reference”.
- 3.105 **prediction**: An embodiment of the *prediction process*.
- 3.106 **prediction process**: The use of a *predictor* to provide an estimate of the sample value or data element currently being decoded.
- 3.107 **predictive slice**: See *P slice*.
- 3.108 **predictor**: A combination of specified values or previously decoded sample values or data elements used in the *decoding process* of subsequent sample values or data elements.
- 3.109 **primary coded picture**: The coded representation of a *picture* to be used by the *decoding process* for a bitstream conforming to this Recommendation | International Standard. The primary coded picture contains all *macroblocks* of the *picture*. The only *pictures* that have a normative effect on the *decoding process* are primary coded pictures. See also *redundant coded picture*.
- 3.110 **profile**: A specified subset of the syntax of this Recommendation | International Standard.
- 3.111 **quantisation parameter**: A variable used by the *decoding process* for *scaling* of *transform coefficient levels*.

- 3.112 random access:** The act of starting the decoding process for a *bitstream* at a point other than the beginning of the stream.
- 3.113 raster scan:** A mapping of a rectangular two-dimensional pattern to a one-dimensional pattern such that the first entries in the one-dimensional pattern are from the first top row of the two-dimensional pattern scanned from left to right, followed similarly by the second, third, etc. rows of the pattern (going down) each scanned from left to right.
- 3.114 raw byte sequence payload (RBSP):** A syntax structure containing an integer number of *bytes* that is encapsulated in a *NAL unit*. An RBSP is either empty or has the form of a *string of data bits* containing *syntax elements* followed by an *RBSP stop bit* and followed by zero or more subsequent bits equal to 0.
- 3.115 raw byte sequence payload (RBSP) stop bit:** A bit equal to 1 present within a *raw byte sequence payload (RBSP)* after a *string of data bits*. The location of the end of the *string of data bits* within an *RBSP* can be identified by searching from the end of the *RBSP* for the *RBSP stop bit*, which is the last non-zero bit in the *RBSP*.
- 3.116 recovery point:** A point in the *bitstream* at which the recovery of an exact or an approximate representation of the *decoded pictures* represented by the *bitstream* is achieved after a *random access* or *broken link*.
- 3.117 redundant coded picture:** A coded representation of a *picture* or a part of a *picture*. The content of a redundant coded picture shall not be used by the *decoding process* for a *bitstream* conforming to this Recommendation | International Standard. A *redundant coded picture* is not required to contain all *macroblocks* in the *primary coded picture*. Redundant coded pictures have no normative effect on the *decoding process*. See also *primary coded picture*.
- 3.118 reference field:** A *reference field* may be used for *inter prediction* when *P*, *SP*, and *B slices* of a *coded field* or *field macroblocks* of a *coded frame* are decoded. See also *reference picture*.
- 3.119 reference frame:** A *reference frame* may be used for *inter prediction* when *P*, *SP*, and *B slices* of a *coded frame* are decoded. See also *reference picture*.
- 3.120 reference index:** An index into a *reference picture list*.
- 3.121 reference picture:** A *picture* with *nal_ref_idc* not equal to 0. A *reference picture* contains samples that may be used for *inter prediction* in the *decoding process* of subsequent *pictures* in *decoding order*.
- 3.122 reference picture list:** A list of *reference pictures* that is used for *inter prediction* of a *P*, *B*, or *SP slice*. For the *decoding process* of a *P* or *SP slice*, there is one reference picture list. For the *decoding process* of a *B slice*, there are two reference picture lists.
- 3.123 reference picture list 0:** A *reference picture list* used for *inter prediction* of a *P*, *B*, or *SP slice*. All *inter prediction* used for *P* and *SP slices* uses reference picture list 0. Reference picture list 0 is one of two *reference picture lists* used for *inter prediction* for a *B slice*, with the other being *reference picture list 1*.
- 3.124 reference picture list 1:** A *reference picture list* used for *inter prediction* of a *B slice*. Reference picture list 1 is one of two lists of *reference picture lists* used for *inter prediction* for a *B slice*, with the other being *reference picture list 0*.
- 3.125 reference picture marking:** Specifies, in the *bitstream*, how the *decoded pictures* are marked for *inter prediction*.
- 3.126 reserved:** The term reserved, when used in the clauses specifying some values of a particular *syntax element*, are for future use by ITU-T | ISO/IEC. These values shall not be used in *bitstreams* conforming to this Recommendation | International Standard, but may be used in future extensions of this Recommendation | International Standard by ITU-T | ISO/IEC.
- 3.127 residual:** The decoded difference between a *prediction* of a sample or data element and its decoded value.
- 3.128 run:** A number of consecutive data elements represented in the decoding process. In one context, the number of zero-valued *transform coefficient levels* preceding a non-zero *transform coefficient level* in the list of *transform coefficient levels* generated by a *zig-zag scan* or a *field scan*. In other contexts, run refers to a number of *macroblocks*.
- 3.129 sample aspect ratio:** Specifies, for assisting the display process, which is not specified in this Recommendation | International Standard, the ratio between the intended horizontal distance between the columns and the intended vertical distance between the rows of the *luma* sample array in a *frame*. Sample

aspect ratio is expressed as $h:v$, where h is horizontal width and v is vertical height (in arbitrary units of spatial distance).

- 3.130 **scaling**: The process of multiplying *transform coefficient levels* by a factor, resulting in *transform coefficients*.
- 3.131 **sequence parameter set**: A *syntax structure* containing *syntax elements* that apply to zero or more entire *coded video sequences* as determined by the content of a *seq_parameter_set_id syntax element* found in the *picture parameter set* referred to by the *pic_parameter_set_id syntax element* found in each *slice header*.
- 3.132 **shall**: A term used to express mandatory requirements for conformance to this Recommendation | International Standard. When used to express a mandatory constraint on the values of *syntax elements* or on the results obtained by operation of the specified *decoding process*, it is the responsibility of the *encoder* to ensure that the constraint is fulfilled. When used in reference to operations performed by the *decoding process*, any *decoding process* that produces identical results to the *decoding process* described herein conforms to the *decoding process* requirements of this Recommendation | International Standard.
- 3.133 **should**: A term used to refer to behaviour of an implementation that is encouraged to be followed under anticipated ordinary circumstances, but is not a mandatory requirement for conformance to this Recommendation | International Standard.
- 3.134 **SI slice**: A *slice* that is coded using *prediction* only from decoded samples within the same *slice* and using quantisation of the *prediction* samples. An SI slice can be coded such that its decoded samples can be constructed identically to an *SP slice*.
- 3.135 **skipped macroblock**: A *macroblock* for which no data is coded other than an indication that the *macroblock* is to be decoded as "skipped". This indication may be common to several *macroblocks*.
- 3.136 **slice**: An integer number of *macroblocks* or *macroblock pairs* ordered consecutively in the *raster scan* within a particular *slice group*. For the *primary coded picture*, the division of each *slice group* into slices is a *partitioning*. Although a slice contains *macroblocks* or *macroblock pairs* that are consecutive in the *raster scan* within a *slice group*, these *macroblocks* or *macroblock pairs* are not necessarily consecutive in the *raster scan* within the *picture*. The addresses of the *macroblocks* are derived from the address of the first *macroblock* in a slice (as represented in the *slice header*) and the *macroblock to slice group map*.
- 3.137 **slice data partitioning**: A method of *partitioning* selected *syntax elements* into *syntax structures* based on a *category* associated with each *syntax element*.
- 3.138 **slice group**: A subset of the *macroblocks* or *macroblock pairs* of a *picture*. The division of the *picture* into slice groups is a *partitioning* of the *picture*. The partitioning is specified by the *macroblock to slice group map*.
- 3.139 **slice group map units**: The units of the *map unit to slice group map*.
- 3.140 **slice header**: A part of a coded *slice* containing the data elements pertaining to the first or all *macroblocks* represented in the *slice*.
- 3.141 **source**: Term used to describe the video material or some of its attributes before encoding.
- 3.142 **SP slice**: A *slice* that is coded using *inter prediction* from previously-decoded *reference pictures*, using at most one *motion vector* and *reference index* to *predict* the sample values of each *block*. An SP slice can be coded such that its decoded samples can be constructed identically to another SP slice or an *SI slice*.
- 3.143 **start code prefix**: A unique sequence of three *bytes* equal to 0x000001 embedded in the *byte stream* as a prefix to each *NAL unit*. The location of a start code prefix can be used by a *decoder* to identify the beginning of a new *NAL unit* and the end of a previous *NAL unit*. Emulation of start code prefixes is prevented within *NAL units* by the inclusion of *emulation prevention bytes*.
- 3.144 **string of data bits (SODB)**: A sequence of some number of bits representing *syntax elements* present within a *raw byte sequence payload* prior to the *raw byte sequence payload stop bit*. Within an SODB, the left-most bit is considered to be the first and most significant bit, and the right-most bit is considered to be the last and least significant bit.
- 3.145 **sub-macroblock**: One quarter of the samples of a *macroblock*, i.e., an 8x8 *luma block* and two corresponding *chroma blocks* of which one corner is located at a corner of the *macroblock*.
- 3.146 **sub-macroblock partition**: A *block* of *luma* samples and two corresponding *blocks* of *chroma* samples resulting from a *partitioning* of a *sub-macroblock* for *inter prediction*.

- 3.147 switching I slice:** See *SI slice*.
- 3.148 switching P slice:** See *SP slice*.
- 3.149 syntax element:** An element of data represented in the *bitstream*.
- 3.150 syntax structure:** Zero or more *syntax elements* present together in the *bitstream* in a specified order.
- 3.151 top field:** One of two *fields* that comprise a *frame*. Each row of a *top field* is spatially located immediately above the corresponding row of the *bottom field*.
- 3.152 top macroblock (of a macroblock pair):** The *macroblock* within a *macroblock pair* that contains the samples in the top row of samples for the *macroblock pair*. For a *field macroblock pair*, the top macroblock represents the samples from the region of the *top field* of the *frame* that lie within the spatial region of the *macroblock pair*. For a *frame macroblock pair*, the top macroblock represents the samples of the *frame* that lie within the top half of the spatial region of the *macroblock pair*.
- 3.153 transform coefficient:** A scalar quantity, considered to be in a frequency domain, that is associated with a particular one-dimensional or two-dimensional *frequency index* in an *inverse transform* part of the *decoding process*.
- 3.154 transform coefficient level:** An integer quantity representing the value associated with a particular two-dimensional frequency index in the *decoding process* prior to *scaling* for computation of a *transform coefficient* value.
- 3.155 universal unique identifier (UUID):** An identifier that is unique with respect to the space of all universal unique identifiers.
- 3.156 unspecified:** The term unspecified, when used in the clauses specifying some values of a particular *syntax element*, indicates that the values have no specified meaning in this Recommendation | International Standard and will not have a specified meaning in the future as an integral part of this Recommendation | International Standard.
- 3.157 variable length coding (VLC):** A reversible procedure for entropy coding that assigns shorter bit strings to *symbols* expected to be more frequent and longer bit strings to *symbols* expected to be less frequent.
- 3.158 zig-zag scan:** A specific sequential ordering of *transform coefficient levels* from (approximately) the lowest spatial frequency to the highest. Zig-zag scan is used for *transform coefficient levels* in *frame macroblocks*.

5 Conventions

NOTE - The mathematical operators used in this Specification are similar to those used in the C programming language. However, integer division and arithmetic shift operations are specifically defined. Numbering and counting conventions generally begin from 0.

5.1 Arithmetic operators

The following arithmetic operators are defined as follows.

- $+$ Addition
- $-$ Subtraction (as a two-argument operator) or negation (as a unary prefix operator)
- $*$ Multiplication
- x^y Exponentiation. Specifies x to the power of y . In other contexts, such notation is used for superscripting not intended for interpretation as exponentiation.
- $/$ Integer division with truncation of the result toward zero. For example, $7/4$ and $-7/-4$ are truncated to 1 and $-7/4$ and $7/-4$ are truncated to -1 .
- $\div$ Used to denote division in mathematical equations where no truncation or rounding is intended.
- $\frac{x}{y}$ Used to denote division in mathematical equations where no truncation or rounding is intended.
- $\sum_{i=x}^y f(i)$ The summation of $f(i)$ with i taking all integer values from x up to and including y .
- $x \% y$ Modulus. Remainder of x divided by y , defined only for integers x and y with $x \geq 0$ and $y > 0$.

When order of precedence is not indicated explicitly by use of parenthesis, the following rules apply

- multiplication and division operations are considered to take place before addition and subtraction
- multiplication and division operations in sequence are evaluated sequentially from left to right
- addition and subtraction operations in sequence are evaluated sequentially from left to right

5.2 Logical operators

The following logical operators are defined as follows

- $x \ \&\& \ y$ Boolean logical "and" of x and y
- $x \ || \ y$ Boolean logical "or" of x and y
- $!$ Boolean logical "not"
- $x \ ? \ y : z$ If x is TRUE or not equal to 0, evaluates to the value of y ; otherwise, evaluates to the value of z

5.3 Relational operators

The following relational operators are defined as follows

>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
=	Equal to
!=	Not equal to

When a relational operator is applied to a syntax element or variable that has been assigned the value "na" (not applicable), the value "na" is treated as a distinct value for the syntax element or variable. The value "na" is considered not to be equal to any other value.

5.4 Bit-wise operators

The following bit-wise operators are defined as follows

&	Bit-wise "and". When operating on integer arguments, operates on a two's complement representation of the integer value. When operating on a binary argument that contains fewer bits than another argument, the shorter argument is extended by adding more significant bits equal to 0.
	Bit-wise "or". When operating on integer arguments, operates on a two's complement representation of the integer value. When operating on a binary argument that contains fewer bits than another argument, the shorter argument is extended by adding more significant bits equal to 0.
$x \gg y$	Arithmetic right shift of a two's complement integer representation of x by y binary digits. This function is defined only for positive integer values of y . Bits shifted into the MSBs as a result of the right shift shall have a value equal to the MSB of x prior to the shift operation.
$x \ll y$	Arithmetic left shift of a two's complement integer representation of x by y binary digits. This function is defined only for positive integer values of y . Bits shifted into the LSBs as a result of the left shift have a value equal to 0.

5.5 Assignment operators

The following arithmetic operators are defined as follows

=	Assignment operator.
++	Increment, i.e., $x++$ is equivalent to $x = x + 1$; when used in an array index, evaluates to the value of the variable prior to the increment operation.
--	Decrement, i.e., $x--$ is equivalent to $x = x - 1$; when used in an array index, evaluates to the value of the variable prior to the decrement operation.
+=	Increment by amount specified, i.e., $x += 3$ is equivalent to $x = x + 3$, and $x += (-3)$ is equivalent to $x = x + (-3)$.
-=	Decrement by amount specified, i.e., $x -= 3$ is equivalent to $x = x - 3$, and $x -= (-3)$ is equivalent to $x = x - (-3)$.

5.6 Range notation

The following notation is used to specify a range of values

$x = y .. z$ x takes on integer values starting from y to z inclusive, with x , y , and z being integer numbers.

5.7 Mathematical functions

The following mathematical functions are defined as follows

$$\text{Abs}(x) = \begin{cases} x & ; \quad x \geq 0 \\ -x & ; \quad x < 0 \end{cases} \quad (5-1)$$

$\text{Ceil}(x)$ the smallest integer greater than or equal to x . (5-2)

$$\text{Clip1}_V(x) = \text{Clip3}(0, (1 \ll \text{BitDepth}_V) - 1, x) \quad (5-3)$$

$$\text{Clip1}_C(x) = \text{Clip3}(0, (1 \ll \text{BitDepth}_C) - 1, x) \quad (5-4)$$

$$\text{Clip3}(x, y, z) = \begin{cases} x & ; \quad z < x \\ y & ; \quad z > y \\ z & ; \quad \text{otherwise} \end{cases} \quad (5-5)$$

$\text{Floor}(x)$ the greatest integer less than or equal to x . (5-6)

$$\text{InverseRasterScan}(a, b, c, d, e) = \begin{cases} (a\%(d/b)) * b; & e == 0 \\ (a/(d/b)) * c; & e == 1 \end{cases} \quad (5-7)$$

$\text{Log2}(x)$ returns the base-2 logarithm of x . (5-8)

$\text{Log10}(x)$ returns the base-10 logarithm of x . (5-9)

$$\text{Median}(x, y, z) = x + y + z - \text{Min}(x, \text{Min}(y, z)) - \text{Max}(x, \text{Max}(y, z)) \quad (5-10)$$

$$\text{Min}(x, y) = \begin{cases} x & ; \quad x \leq y \\ y & ; \quad x > y \end{cases} \quad (5-11)$$

$$\text{Max}(x, y) = \begin{cases} x & ; \quad x \geq y \\ y & ; \quad x < y \end{cases} \quad (5-12)$$

$$\text{Round}(x) = \text{Sign}(x) * \text{Floor}(\text{Abs}(x) + 0.5) \quad (5-13)$$

$$\text{Sign}(x) = \begin{cases} 1 & ; \quad x \geq 0 \\ -1 & ; \quad x < 0 \end{cases} \quad (5-14)$$

$$\text{Sqrt}(x) = \sqrt{x} \quad (5-15)$$

5.8 Variables, syntax elements, and tables

Syntax elements in the bitstream are represented in **bold** type. Each syntax element is described by its name (all lower case letters with underscore characters), its one or two syntax categories, and one or two descriptors for its method of coded representation. The decoding process behaves according to the value of the syntax element and to the values of previously decoded syntax elements. When a value of a syntax element is used in the syntax tables or the text, it appears in regular (i.e., not bold) type.

In some cases the syntax tables may use the values of other variables derived from syntax elements values. Such variables appear in the syntax tables, or text, named by a mixture of lower case and upper case letter and without any underscore characters. Variables starting with an upper case letter are derived for the decoding of the current syntax structure and all depending syntax structures. Variables starting with an upper case letter may be used in the decoding process for later syntax structures mentioning the originating syntax structure of the variable. Variables starting with a lower case letter are only used within the subclause in which they are derived.

In some cases, "mnemonic" names for syntax element values or variable values are used interchangeably with their numerical values. Sometimes "mnemonic" names are used without any associated numerical values. The association of values and names is specified in the text. The names are constructed from one or more groups of letters separated by an underscore character. Each group starts with an upper case letter and may contain more upper case letters.

NOTE - The syntax is described in a manner that closely follows the C-language syntactic constructs.

Functions are described by their names, which are constructed as syntax element names, with left and right round parentheses including zero or more variable names (for definition) or values (for usage), separated by commas (if more than one variable).

A one-dimensional array is referred to as a list. A two-dimensional array is referred to as a matrix. Arrays can either be syntax elements or variables. Subscripts or square parentheses are used for the indexing of arrays. In reference to a visual depiction of a matrix, the first subscript is used as a row (vertical) index and the second subscript is used as a column (horizontal) index. The indexing order is reversed when using square parentheses rather than subscripts for indexing. Thus, an element of a matrix *s* at horizontal position *x* and vertical position *y* may be denoted either as *s*[*x*, *y*] or as *s*_{*yx*}.

Binary notation is indicated by enclosing the string of bit values by single quote marks. For example, '01000001' represents an eight-bit string having only its second and its last bits equal to 1.

Hexadecimal notation, indicated by prefixing the hexadecimal number by "0x", may be used instead of binary notation when the number of bits is an integer multiple of 4. For example, 0x41 represents an eight-bit string having only its second and its last bits equal to 1.

Numerical values not enclosed in single quotes and not prefixed by "0x" are decimal values.

A value equal to 0 represents a FALSE condition in a test statement. The value TRUE is represented by any other value different than zero.

5.9 Text description of logical operations

In the text, a statement of logical operations as would be described in pseudo-code as

```
if( condition 0 )
    statement 0
else if ( condition 1 )
    statement 1
...
else /* informative remark on remaining condition */
    statement n
```

may be described in the following manner:

... as follows / ... the following applies.

- If condition 0, statement 0
- Otherwise, if condition 1, statement 1
- ...

Otherwise (informative remark on remaining condition), statement n

Each "If...Otherwise, if...Otherwise, ..." statement in the text is introduced with "... as follows" or "... the following applies" immediately followed by "If ... ". The last condition of the "If...Otherwise, if...Otherwise, ..." is always an "Otherwise, ...". Interleaved "If...Otherwise, if...Otherwise, ..." statements can be identified by matching "... as follows" or "... the following applies" with the ending "Otherwise, ...".

In the text, a statement of logical operations as would be described in pseudo-code as

```
if( condition 0a && condition 0b )
    statement 0
else if ( condition 1a || condition 1b )
    statement 1
...
```

```
else  
    statement n
```

may be described in the following manner:

... as follows / ... the following applies.

- If all of the following conditions are true, statement 0
 - condition 0a
 - condition 0b
- Otherwise, if any of the following conditions are true, statement 1
 - condition 1a
 - condition 1b
- ...
- Otherwise, statement n

In the text, a statement of logical operations as would be described in pseudo-code as

```
if( condition 0 )  
    statement 0  
if ( condition 1 )  
    statement 1
```

may be described in the following manner:

```
When condition 0, statement 0  
When condition 1, statement 1
```

5.10 Processes

Processes are used to describe the decoding of syntax elements. A process has a separate specification and invoking. All syntax elements and upper case variables that pertain to the current syntax structure and depending syntax structures are available in the process specification and invoking. A process specification may also have a lower case variable explicitly specified as the input. Each process specification has explicitly specified an output. The output is a variable that can either be an upper case variable or a lower case variable.

The assignment of variables is specified as follows.

- If invoking a process, variables are explicitly assigned to lower case input or output variables of the process specification in case these do not have the same name.
- Otherwise (when the variables at the invoking and specification have the same name), assignment is implied.

In the specification of a process, a specific macroblock may be referred to by the variable name having a value equal to the address of the specific macroblock.

6 Source, coded, decoded and output data formats, scanning processes, and neighbouring relationships

6.1 Bitstream formats

This subclause specifies the relationship between the NAL unit stream and byte stream, either of which are referred to as the bitstream.

The bitstream can be in one of two formats: the NAL unit stream format or the byte stream format. The NAL unit stream format is conceptually the more "basic" type. It consists of a sequence of syntax structures called NAL units. This sequence is ordered in decoding order. There are constraints imposed on the decoding order (and contents) of the NAL units in the NAL unit stream.

The byte stream format can be constructed from the NAL unit stream format by ordering the NAL units in decoding order and prefixing each NAL unit with a start code prefix and zero or more zero-valued bytes to form a stream of bytes. The NAL unit stream format can be extracted from the byte stream format by searching for the location of the unique start code prefix pattern within this stream of bytes. Methods of framing the NAL units in a manner other than use of the byte stream format are outside the scope of this Recommendation | International Standard. The byte stream format is specified in Annex 0.

6.2 Source, decoded, and output picture formats

This subclause specifies the relationship between source and decoded frames and fields that is given via the bitstream.

The video source that is represented by the bitstream is a sequence of either or both frames or fields (called collectively pictures) in decoding order.

The source and decoded pictures (frames or fields) are each comprised of one or more sample arrays:

- Luma (Y) only (monochrome), with or without an auxiliary array
- Luma and two Chroma (YCbCr or YCgCo), with or without an auxiliary array
- Green, Blue and Red (GBR, also known as RGB), with or without an auxiliary array
- Arrays representing other unspecified monochrome or tri-stimulus colour samplings (for example, YZX, also known as XYZ), with or without an auxiliary array

For convenience of notation and terminology in this specification, the variables and terms associated with these arrays are referred to as luma (or L or Y) and chroma, where the two chroma arrays are referred to as Cb and Cr; regardless of the actual colour representation method in use. The actual colour representation method in use can be indicated in syntax that is specified in Annex E. The (monochrome) auxiliary arrays, which may or may not be present as auxiliary pictures in a coded video sequence, are optional for decoding and can be used for such purposes as alpha blending.

The variables SubWidthC, and SubHeightC are specified in Table 6-1, depending on the chroma format sampling structure, which is specified through chroma_format_idc. An entry marked as "-" in Table 6-1 denotes an undefined value for SubWidthC or SubHeightC. Other values of chroma_format_idc, SubWidthC, and SubHeightC may be specified in the future by ITU-T | ISO/IEC.

Table 6-1 –SubWidthC, and SubHeightC values derived from chroma_format_idc

chroma_format_idc	Chroma Format	SubWidthC	SubHeightC
0	monochrome	-	-
1	4:2:0	2	2
2	4:2:2	2	1
3	4:4:4	1	1

In monochrome sampling there is only one sample array, which shall nominally be considered the luma array.

In 4:2:0 sampling, each of the two chroma arrays has half the height and half the width of the luma array.

In 4:2:2 sampling, each of the two chroma arrays has the same height and half the width of the luma array.

In 4:4:4 sampling, each of the two chroma arrays has the same height and width as the luma array.

The width and height of the luma sample arrays are each an integer multiple of 16. In bitstreams using 4:2:0 chroma sampling, the width and height of chroma sample arrays are each an integer multiple of 8. In bitstreams using 4:2:2 sampling, the width of the chroma sample arrays is an integer multiple of 8 and the height is an integer multiple of 16. The height of a luma array that is coded as two separate fields or in macroblock-adaptive frame-field coding (see below) is an integer multiple of 32. In bitstreams using 4:2:0 chroma sampling, the height of each chroma array that is coded as two separate fields or in macroblock-adaptive frame-field coding (see below) is an integer multiple of 16. The width or height of pictures output from the decoding process need not be an integer multiple of 16 and can be specified using a cropping rectangle.

The syntax for the luma and (when present) chroma arrays are ordered such when data for all three colour components is present, the data for the luma array is first, followed by any data for the Cb array, followed by any data for the Cr array, unless otherwise specified.

The width of fields coded referring to a specific sequence parameter set is the same as that of frames coded referring to the same sequence parameter set (see below). The height of fields coded referring to a specific sequence parameter set is half that of frames coded referring to the same sequence parameter set (see below).

The number of bits necessary for the representation of each of the samples in the luma and chroma arrays in a video sequence is in the range of 8 to 12, and the number of bits used in the luma array may differ from the number of bits used in the chroma arrays.

When the value of chroma_format_idc is equal to 1, the nominal vertical and horizontal relative locations of luma and chroma samples in frames are shown in Figure 6-1. Alternative chroma sample relative locations may be indicated in video usability information (see Annex E).

Figure 6-1 – Nominal vertical and horizontal locations of 4:2:0 luma and chroma samples in a frame

A frame consists of two fields as described below. A coded picture may represent a coded frame or an individual coded field. A coded video sequence conforming to this Recommendation | International Standard may contain arbitrary combinations of coded frames and coded fields. The decoding process is also specified in a manner that allows smaller regions of a coded frame to be coded either as a frame or field region, by use of macroblock-adaptive frame-field coding.

Source and decoded fields are one of two types: top field or bottom field. When two fields are output at the same time, or are combined to be used as a reference frame (see below), the two fields (which shall be of opposite parity) are interleaved. The first (i.e., top), third, fifth, etc. rows of a decoded frame are the top field rows. The second, fourth, sixth, etc. rows of a decoded frame are the bottom field rows. A top field consists of only the top field rows of a decoded frame. When the top field or bottom field of a decoded frame is used as a reference field (see below) only the even rows (for a top field) or the odd rows (for a bottom field) of the decoded frame are used.

When the value of chroma_format_idc is equal to 1, the nominal vertical and horizontal relative locations of luma and chroma samples in top and bottom fields are shown in Figure 6-2. The nominal vertical sampling relative locations of the chroma samples in a top field are specified as shifted up by one-quarter luma sample height relative to the field-sampling grid. The vertical sampling locations of the chroma samples in a bottom field are specified as shifted down by one-quarter luma sample height relative to the field-sampling grid. Alternative chroma sample relative locations may be indicated in the video usability information (see Annex E).

NOTE – The shifting of the chroma samples is in order for these samples to align vertically to the usual location relative to the full-frame sampling grid as shown in Figure 6-1.

Figure 6-2 – Nominal vertical and horizontal sampling locations of 4:2:0 samples in top and bottom fields.

When the value of chroma_format_idc is equal to 2, the chroma samples are co-sited with the corresponding luma samples and the nominal locations in a frame and in fields are as shown in Figure 6-3 and Figure 6-4, respectively.

Figure 6-3 – Nominal vertical and horizontal locations of 4:2:2 luma and chroma samples in a frame

Figure 6-4 – Nominal vertical and horizontal sampling locations of 4:2:2 samples top and bottom fields

When the value of chroma_format_idc is equal to 3, all array samples are co-sited for all cases of frames and fields and the nominal locations in a frame and in fields are as shown in Figure 6-5 and Figure 6-6, respectively.

Figure 6-5 – Nominal vertical and horizontal locations of 4:4:4 luma and chroma samples in a frame

Figure 6-6 – Nominal vertical and horizontal sampling locations of 4:4:4 samples top and bottom fields

The samples are processed in units of macroblocks. The luma array for each macroblock is 16 samples in both width and height. The variables MbWidthC and MbHeightC, which specify the width and height, respectively, of the chroma arrays for each macroblock, are derived as follows.

- If chroma_format_idc is equal to 0 (monochrome), MbWidthC and MbHeightC are both equal to 0 (as no chroma arrays are specified for monochrome video).
- Otherwise, MbWidthC and MbHeightC are derived as

$$\text{MbWidthC} = 16 / \text{SubWidthC} \quad (6-1)$$

$$\text{MbHeightC} = 16 / \text{SubHeightC} \quad (6-2)$$

6.3 Spatial subdivision of pictures and slices

This subclause specifies how a picture is partitioned into slices and macroblocks. Pictures are divided into slices. A slice is a sequence of macroblocks, or, when macroblock-adaptive frame/field decoding is in use, a sequence of macroblock pairs.

Each macroblock is comprised of one 16x16 luma array and, when the video format is not monochrome, two corresponding chroma sample arrays. When macroblock-adaptive frame/field decoding is not in use, each macroblock represents a spatial rectangular region of the picture. For example, a picture may be divided into two slices as shown in Figure 6-7.

Figure 6-7 – A picture with 11 by 9 macroblocks that is partitioned into two slices

When macroblock-adaptive frame/field decoding is in use, the picture is partitioned into slices containing an integer number of macroblock pairs as shown in Figure 6-8. Each macroblock pair consists of two macroblocks.

Figure 6-8 – Partitioning of the decoded frame into macroblock pairs

6.4 Inverse scanning processes and derivation processes for neighbours

This subclause specifies inverse scanning processes; i.e., the mapping of indices to locations, and derivation processes for neighbours.

6.4.1 Inverse macroblock scanning process

Input to this process is a macroblock address `mbAddr`.

Output of this process is the location (`x`, `y`) of the upper-left luma sample for the macroblock with address `mbAddr` relative to the upper-left sample of the picture.

The inverse macroblock scanning process is specified as follows.

- If `MbaffFrameFlag` is equal to 0,

$$x = \text{InverseRasterScan}(\text{mbAddr}, 16, 16, \text{PicWidthInSamples}_L, 0) \quad (6-3)$$

$$y = \text{InverseRasterScan}(\text{mbAddr}, 16, 16, \text{PicWidthInSamples}_L, 1) \quad (6-4)$$

- Otherwise (`MbaffFrameFlag` is equal to 1), the following applies.

$$xO = \text{InverseRasterScan}(\text{mbAddr} / 2, 16, 32, \text{PicWidthInSamples}_L, 0) \quad (6-5)$$

$$yO = \text{InverseRasterScan}(\text{mbAddr} / 2, 16, 32, \text{PicWidthInSamples}_L, 1) \quad (6-6)$$

Depending on the current macroblock the following applies.

- If the current macroblock is a frame macroblock

$$x = xO \quad (6-7)$$

$$y = yO + (\text{mbAddr} \% 2) * 16 \quad (6-8)$$

- Otherwise (the current macroblock is a field macroblock),

$$x = xO \quad (6-9)$$

$$y = yO + (\text{mbAddr} \% 2) \quad (6-10)$$

6.4.2 Inverse macroblock partition and sub-macroblock partition scanning process

Macroblocks or sub-macroblocks may be partitioned, and the partitions are scanned for inter prediction as shown in Figure 6-9. The outer rectangles refer to the samples in a macroblock or sub-macroblock, respectively. The rectangles refer to the partitions. The number in each rectangle specifies the index of the inverse macroblock partition scan or inverse sub-macroblock partition scan.

The functions `MbPartWidth( )`, `MbPartHeight( )`, `SubMbPartWidth( )`, and `SubMbPartHeight( )` describing the width and height of macroblock partitions and sub-macroblock partitions are specified in Table 7-13, Table 7-14, Table 7-17, and Table 7-18. `MbPartWidth( )` and `MbPartHeight( )` are set to appropriate values for each macroblock, depending on the macroblock type. `SubMbPartWidth( )` and `SubMbPartHeight( )` are set to appropriate values for each sub-macroblock of a macroblock with `mb_type` equal to `P_8x8`, `P_8x8ref0`, or `B_8x8`, depending on the sub-macroblock type.

Figure 6-9 – Macroblock partitions, sub-macroblock partitions, macroblock partition scans, and sub-macroblock partition scans

6.4.2.1 Inverse macroblock partition scanning process

Input to this process is the index of a macroblock partition `mbPartIdx`.

Output of this process is the location (`x`, `y`) of the upper-left luma sample for the macroblock partition `mbPartIdx` relative to the upper-left sample of the macroblock.

The inverse macroblock partition scanning process is specified by

$$x = \text{InverseRasterScan}(\text{mbPartIdx}, \text{MbPartWidth}(\text{mb_type}), \text{MbPartHeight}(\text{mb_type}), 16, 0) \quad (6-11)$$

$$y = \text{InverseRasterScan}(\text{mbPartIdx}, \text{MbPartWidth}(\text{mb_type}), \text{MbPartHeight}(\text{mb_type}), 16, 1) \quad (6-12)$$

6.4.2.2 Inverse sub-macroblock partition scanning process

Inputs to this process are the index of a macroblock partition `mbPartIdx` and the index of a sub-macroblock partition `subMbPartIdx`.

Output of this process is the location (`x`, `y`) of the upper-left luma sample for the sub-macroblock partition `subMbPartIdx` relative to the upper-left sample of the sub-macroblock.

The inverse sub-macroblock partition scanning process is specified as follows.

- If `mb_type` is equal to `P_8x8`, `P_8x8ref0`, or `B_8x8`,

$$x = \text{InverseRasterScan}(\text{subMbPartIdx}, \text{SubMbPartWidth}(\text{sub_mb_type}[\text{mbPartIdx}]), \text{SubMbPartHeight}(\text{sub_mb_type}[\text{mbPartIdx}]), 8, 0) \quad (6-13)$$

$$y = \text{InverseRasterScan}(\text{subMbPartIdx}, \text{SubMbPartWidth}(\text{sub_mb_type}[\text{mbPartIdx}]), \text{SubMbPartHeight}(\text{sub_mb_type}[\text{mbPartIdx}]), 8, 1) \quad (6-14)$$

- Otherwise,

$$x = \text{InverseRasterScan}(\text{subMbPartIdx}, 4, 4, 8, 0) \quad (6-15)$$

$$y = \text{InverseRasterScan}(\text{subMbPartIdx}, 4, 4, 8, 1) \quad (6-16)$$

6.4.3 Inverse 4x4 luma block scanning process

Input to this process is the index of a 4x4 luma block `luma4x4BlkIdx`.

Output of this process is the location (x, y) of the upper-left luma sample for the 4x4 luma block with index `luma4x4BlkIdx` relative to the upper-left luma sample of the macroblock.

Figure 6-10 shows the scan for the 4x4 luma blocks.

0	1	4	5
2	3	6	7
8	9	12	13
10	11	14	15

Figure 6-10 – Scan for 4x4 luma blocks

The inverse 4x4 luma block scanning process is specified by

$$x = \text{InverseRasterScan}(\text{luma4x4BlkIdx} / 4, 8, 8, 16, 0) + \text{InverseRasterScan}(\text{luma4x4BlkIdx} \% 4, 4, 4, 8, 0) \quad (6-17)$$

$$y = \text{InverseRasterScan}(\text{luma4x4BlkIdx} / 4, 8, 8, 16, 1) + \text{InverseRasterScan}(\text{luma4x4BlkIdx} \% 4, 4, 4, 8, 1) \quad (6-18)$$

6.4.4 Inverse 8x8 luma block scanning process

Input to this process is the index of an 8x8 luma block `luma8x8BlkIdx`.

Output of this process is the location (x, y) of the upper-left luma sample for the 8x8 luma block with index `luma8x8BlkIdx` relative to the upper-left luma sample of the macroblock.

Figure 6-11 shows the scan for the 8x8 luma blocks.

0	1
2	3

Figure 6-11 – Scan for 8x8 luma blocks

The inverse 8x8 luma block scanning process is specified by

$$x = \text{InverseRasterScan}(\text{luma8x8BlkIdx}, 8, 8, 16, 0) \quad (6-19)$$

$$y = \text{InverseRasterScan}(\text{luma8x8BlkIdx}, 8, 8, 16, 1) \quad (6-20)$$

6.4.5 Derivation process of the availability for macroblock addresses

Input to this process is a macroblock address `mbAddr`.

Output of this process is the availability of the macroblock `mbAddr`.

NOTE – The meaning of availability is determined when this process is invoked.

The macroblock is marked as available, unless one of the following conditions is true in which case the macroblock shall be marked as not available:

- $mbAddr < 0$
- $mbAddr > CurrMbAddr$
- the macroblock with address $mbAddr$ belongs to a different slice than the macroblock with address $CurrMbAddr$

6.4.6 Derivation process for neighbouring macroblock addresses and their availability

This process can only be invoked when $MbaffFrameFlag$ is equal to 0.

The outputs of this process are

- $mbAddrA$: the address and availability status of the macroblock to the left of the current macroblock.
- $mbAddrB$: the address and availability status of the macroblock above the current macroblock.
- $mbAddrC$: the address and availability status of the macroblock above-right of the current macroblock.
- $mbAddrD$: the address and availability status of the macroblock above-left of the current macroblock.

Figure 6-12 shows the relative spatial locations of the macroblocks with $mbAddrA$, $mbAddrB$, $mbAddrC$, and $mbAddrD$ relative to the current macroblock with $CurrMbAddr$.

$mbAddrD$	$mbAddrB$	$mbAddrC$
$mbAddrA$	$CurrMbAddr$	

Figure 6-12 – Neighbouring macroblocks for a given macroblock

Input to the process in subclause 6.4.5 is $mbAddrA = CurrMbAddr - 1$ and the output is whether the macroblock $mbAddrA$ is available. In addition, $mbAddrA$ is marked as not available when $CurrMbAddr \% PicWidthInMbs$ is equal to 0.

Input to the process in subclause 6.4.5 is $mbAddrB = CurrMbAddr - PicWidthInMbs$ and the output is whether the macroblock $mbAddrB$ is available.

Input to the process in subclause 6.4.5 is $mbAddrC = CurrMbAddr - PicWidthInMbs + 1$ and the output is whether the macroblock $mbAddrC$ is available. In addition, $mbAddrC$ is marked as not available when $(CurrMbAddr + 1) \% PicWidthInMbs$ is equal to 0.

Input to the process in subclause 6.4.5 is $mbAddrD = CurrMbAddr - PicWidthInMbs - 1$ and the output is whether the macroblock $mbAddrD$ is available. In addition, $mbAddrD$ is marked as not available when $CurrMbAddr \% PicWidthInMbs$ is equal to 0.

6.4.7 Derivation process for neighbouring macroblock addresses and their availability in MBAFF frames

This process can only be invoked when $MbaffFrameFlag$ is equal to 1.

The outputs of this process are

- $mbAddrA$: the address and availability status of the top macroblock of the macroblock pair to the left of the current macroblock pair.
- $mbAddrB$: the address and availability status of the top macroblock of the macroblock pair above the current macroblock pair.

- mbAddrC: the address and availability status of the top macroblock of the macroblock pair above-right of the current macroblock pair.
- mbAddrD: the address and availability status of the top macroblock of the macroblock pair above-left of the current macroblock pair.

Figure 6-13 shows the relative spatial locations of the macroblocks with mbAddrA, mbAddrB, mbAddrC, and mbAddrD relative to the current macroblock with CurrMbAddr.

mbAddrA, mbAddrB, mbAddrC, and mbAddrD have identical values regardless whether the current macroblock is the top or the bottom macroblock of a macroblock pair.

mbAddrD	mbAddrB	mbAddrC
mbAddrA	CurrMbAddr or CurrMbAddr	

Figure 6-13 – Neighbouring macroblocks for a given macroblock in MBAFF frames

Input to the process in subclause 6.4.5 is $mbAddrA = 2 * (CurrMbAddr / 2 - 1)$ and the output is whether the macroblock mbAddrA is available. In addition, mbAddrA is marked as not available when $(CurrMbAddr / 2) \% PicWidthInMbs$ is equal to 0.

Input to the process in subclause 6.4.5 is $mbAddrB = 2 * (CurrMbAddr / 2 - PicWidthInMbs)$ and the output is whether the macroblock mbAddrB is available.

Input to the process in subclause 6.4.5 is $mbAddrC = 2 * (CurrMbAddr / 2 - PicWidthInMbs + 1)$ and the output is whether the macroblock mbAddrC is available. In addition, mbAddrC is marked as not available when $(CurrMbAddr / 2 + 1) \% PicWidthInMbs$ is equal to 0.

Input to the process in subclause 6.4.5 is $mbAddrD = 2 * (CurrMbAddr / 2 - PicWidthInMbs - 1)$ and the output is whether the macroblock mbAddrD is available. In addition, mbAddrD is marked as not available when $(CurrMbAddr / 2) \% PicWidthInMbs$ is equal to 0.

6.4.8 Derivation processes for neighbouring macroblocks, blocks, and partitions

Subclause 6.4.8.1 specifies the derivation process for neighbouring macroblocks.

Subclause 6.4.8.2 specifies the derivation process for neighbouring 8x8 luma blocks.

Subclause 6.4.8.3 specifies the derivation process for neighbouring 4x4 luma blocks.

Subclause 6.4.8.4 specifies the derivation process for neighbouring 4x4 chroma blocks.

Subclause 6.4.8.5 specifies the derivation process for neighbouring partitions.

Table 6-2 specifies the values for the difference of luma location (xD, yD) for the input and the replacement for N in mbAddrN, mbPartIdxN, subMbPartIdxN, luma8x8BlkIdxN, luma4x4BlkIdxN, and chroma4x4BlkIdxN for the output. These input and output assignments are used in subclauses 6.4.8.1 to 6.4.8.5. The variable predPartWidth is specified when Table 6-2 is referred to.

Table 6-2 – Specification of input and output assignments for subclauses 6.4.8.1 to 6.4.8.5

N	xD	yD
A	-1	0
B	0	-1
C	predPartWidth	-1
D	-1	-1

Figure 6-14 illustrates the relative location of the neighbouring macroblocks, blocks, or partitions A, B, C, and D to the current macroblock, partition, or block, when the current macroblock, partition, or block is in frame coding mode.

Figure 6-14 – Determination of the neighbouring macroblock, blocks, and partitions (informative)

6.4.8.1 Derivation process for neighbouring macroblocks

Outputs of this process are

- mbAddrA: the address of the macroblock to the left of the current macroblock and its availability status and
- mbAddrB: the address of the macroblock above the current macroblock and its availability status.

mbAddrN (with N being A or B) is derived as follows.

- The difference of luma location (xD, yD) is set according to Table 6-2.
- The derivation process for neighbouring locations as specified in subclause 6.4.9 is invoked for luma locations with (xN, yN) equal to (xD, yD), and the output is assigned to mbAddrN.

6.4.8.2 Derivation process for neighbouring 8x8 luma block

Input to this process is an 8x8 luma block index luma8x8BlkIdx.

The luma8x8BlkIdx specifies the 8x8 luma blocks of a macroblock in a raster scan.

Outputs of this process are

- mbAddrA: either equal to CurrMbAddr or the address of the macroblock to the left of the current macroblock and its availability status,
- luma8x8BlkIdxA: the index of the 8x8 luma block to the left of the 8x8 block with index luma8x8BlkIdx and its availability status,
- mbAddrB: either equal to CurrMbAddr or the address of the macroblock above the current macroblock and its availability status,
- luma8x8BlkIdxB: the index of the 8x8 luma block above the 8x8 block with index luma8x8BlkIdx and its availability status.

mbAddrN and luma8x8BlkIdxN (with N being A or B) are derived as follows.

- The difference of luma location (xD, yD) is set according to Table 6-2.
- The luma location (xN, yN) is specified by

$$xN = (\text{luma8x8BlkIdx} \% 2) * 8 + xD \quad (6-21)$$

$$yN = (\text{luma8x8BlkIdx} / 2) * 8 + yD \quad (6-22)$$

- The derivation process for neighbouring locations as specified in subclause 6.4.9 is invoked for luma locations with (xN, yN) as the input and the output is assigned to mbAddrN and (xW, yW).
- The variable luma8x8BlkIdxN is derived as follows.
 - If mbAddrN is not available, luma8x8BlkIdxN is marked as not available.
 - Otherwise (mbAddrN is available), the 8x8 luma block in the macroblock mbAddrN covering the luma location (xW, yW) shall be assigned to luma8x8BlkIdxN.

6.4.8.3 Derivation process for neighbouring 4x4 luma blocks

Input to this process is a 4x4 luma block index luma4x4BlkIdx.

Outputs of this process are

- mbAddrA: either equal to CurrMbAddr or the address of the macroblock to the left of the current macroblock and its availability status,
- luma4x4BlkIdxA: the index of the 4x4 luma block to the left of the 4x4 block with index luma4x4BlkIdx and its availability status,
- mbAddrB: either equal to CurrMbAddr or the address of the macroblock above the current macroblock and its availability status,
- luma4x4BlkIdxB: the index of the 4x4 luma block above the 4x4 block with index luma4x4BlkIdx and its availability status.

mbAddrN and luma4x4BlkIdxN (with N being A or B) are derived as follows.

- The difference of luma location (xD, yD) is set according to Table 6-2.
- The inverse 4x4 luma block scanning process as specified in subclause 6.4.3 is invoked with luma4x4BlkIdx as the input and (x, y) as the output.
- The luma location (xN, yN) is specified by

$$xN = x + xD \quad (6-23)$$

$$yN = y + yD \quad (6-24)$$

- The derivation process for neighbouring locations as specified in subclause 6.4.9 is invoked for luma locations with (xN, yN) as the input and the output is assigned to mbAddrN and (xW, yW).
- The variable luma4x4BlkIdxN is derived as follows.

- If mbAddrN is not available, luma4x4BlkIdxN is marked as not available.
- Otherwise (mbAddrN is available), the 4x4 luma block in the macroblock mbAddrN covering the luma location (xW, yW) shall be assigned to luma4x4BlkIdxN.

6.4.8.4 Derivation process for neighbouring 4x4 chroma blocks

Input to this process is a 4x4 chroma block index chroma4x4BlkIdx.

Outputs of this process are

- mbAddrA (either equal to CurrMbAddr or the address of the macroblock to the left of the current macroblock) and its availability status,
- chroma4x4BlkIdxA (the index of the 4x4 chroma block to the left of the 4x4 chroma block with index chroma4x4BlkIdx) and its availability status,
- mbAddrB (either equal to CurrMbAddr or the address of the macroblock above the current macroblock) and its availability status,
- chroma4x4BlkIdxB (the index of the 4x4 chroma block above the 4x4 chroma block with index chroma4x4BlkIdx) and its availability status.

mbAddrN and chroma4x4BlkIdxN (with N being A or B) are derived as follows.

- The difference of chroma location (xD, yD) is set according to Table 6-2.
- Depending on chroma_format_idc, the position (x, y) of the upper-left sample of the 4x4 chroma block with index chroma4x4BlkIdx is derived as follows

- If chroma_format_idc is equal to 1 or 2, the following applies

$$x = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 0) \quad (6-25)$$

$$y = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 1) \quad (6-26)$$

- Otherwise (chroma_format_idc is equal to 3), the following applies

$$x = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 0) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 0) \quad (6-27)$$

$$y = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 1) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 1) \quad (6-28)$$

- The chroma location (xN, yN) is specified by

$$xN = x + xD \quad (6-29)$$

$$yN = y + yD \quad (6-30)$$

- The derivation process for neighbouring locations as specified in subclause 6.4.9 is invoked for chroma locations with (xN, yN) as the input and the output is assigned to mbAddrN and (xW, yW).
- The variable chroma4x4BlkIdxN is derived as follows.

- If mbAddrN is not available, chroma4x4BlkIdxN is marked as not available.
- Otherwise (mbAddrN is available), the 4x4 chroma block in the macroblock mbAddrN covering the chroma location (xW, yW) is assigned to chroma4x4BlkIdxN.

6.4.8.5 Derivation process for neighbouring partitions

Inputs to this process are

- a macroblock partition index mbPartIdx
- a current sub-macroblock type currSubMbType
- a sub-macroblock partition index subMbPartIdx

Outputs of this process are

- mbAddrA\mbPartIdxA\subMbPartIdxA: specifying the macroblock or sub-macroblock partition to the left of the current macroblock and its availability status, or the sub-macroblock partition CurrMbAddr\mbPartIdx\subMbPartIdx and its availability status,
- mbAddrB\mbPartIdxB\subMbPartIdxB: specifying the macroblock or sub-macroblock partition above the current macroblock and its availability status, or the sub-macroblock partition CurrMbAddr\mbPartIdx\subMbPartIdx and its availability status,
- mbAddrC\mbPartIdxC\subMbPartIdxC: specifying the macroblock or sub-macroblock partition to the right-above of the current macroblock and its availability status, or the sub-macroblock partition CurrMbAddr\mbPartIdx\subMbPartIdx and its availability status,
- mbAddrD\mbPartIdxD\subMbPartIdxD: specifying the macroblock or sub-macroblock partition to the left-above of the current macroblock and its availability status, or the sub-macroblock partition CurrMbAddr\mbPartIdx\subMbPartIdx and its availability status.

mbAddrN, mbPartIdxN, and subMbPartIdx (with N being A, B, C, or D) are derived as follows.

- The inverse macroblock partition scanning process as described in subclause 6.4.2.1 is invoked with mbPartIdx as the input and (x, y) as the output.
 - The location of the upper-left luma sample inside a macroblock partition (xS, yS) is derived as follows.
 - If mb_type is equal to P_8x8, P_8x8ref0 or B_8x8, the inverse sub-macroblock partition scanning process as described in subclause 6.4.2.2 is invoked with subMbPartIdx as the input and (xS, yS) as the output.
 - Otherwise, (xS, yS) are set to (0, 0).
 - The variable predPartWidth in Table 6-2 is specified as follows.
 - If mb_type is equal to P_Skip, B_Skip, or B_Direct_16x16, predPartWidth = 16.
 - Otherwise, if mb_type is equal to B_8x8, the following applies.
 - If currSubMbType is equal to B_Direct_8x8, predPartWidth = 16.
- NOTE – When currSubMbType is equal to B_Direct_8x8 and direct_spatial_mv_pred_flag is equal to 1, the predicted motion vector is the predicted motion vector for the complete macroblock.
- Otherwise, predPartWidth = SubMbPartWidth(sub_mb_type[mbPartIdx]).
 - Otherwise, if mb_type is equal to P_8x8 or P_8x8ref0, predPartWidth = SubMbPartWidth(sub_mb_type[mbPartIdx]).
 - Otherwise, predPartWidth = MbPartWidth(mb_type).
- The difference of luma location (xD, yD) is set according to Table 6-2.
- The neighbouring luma location (xN, yN) is specified by

$$xN = x + xS + xD \quad (6-31)$$

$$yN = y + yS + yD \quad (6-32)$$
- The derivation process for neighbouring locations as specified in subclause 6.4.9 is invoked for luma locations with (xN, yN) as the input and the output is assigned to mbAddrN and (xW, yW).
- Depending on mbAddrN, the following applies.
 - If mbAddrN is not available, the macroblock or sub-macroblock partition mbAddrN\mbPartIdxN\subMbPartIdxN is marked as not available.
 - Otherwise (mbAddrN is available), the following applies.
 - The macroblock partition in the macroblock mbAddrN covering the luma location (xW, yW) shall be assigned to mbPartIdxN and the sub-macroblock partition inside the macroblock partition mbPartIdxN covering the sample (xW, yW) in the macroblock mbAddrN shall be assigned to subMbPartIdxN.
 - When the partition given by mbPartIdxN and subMbPartIdxN is not yet decoded, the macroblock partition mbPartIdxN and the sub-macroblock partition subMbPartIdxN are marked as not available.

NOTE - The latter condition is, for example, the case when $mbPartIdx = 2$, $subMbPartIdx = 3$, $x_D = 4$, $y_D = -1$, i.e., when neighbour C of the last 4x4 luma block of the third sub-macroblock is requested.

6.4.9 Derivation process for neighbouring locations

Input to this process is a luma or chroma location (x_N , y_N) expressed relative to the upper left corner of the current macroblock

Outputs of this process are

- $mbAddrN$: either equal to $CurrMbAddr$ or to the address of neighbouring macroblock that contains (x_N , y_N) and its availability status,
- (x_W , y_W): the location (x_N , y_N) expressed relative to the upper-left corner of the macroblock $mbAddrN$ (rather than relative to the upper-left corner of the current macroblock).

Let $maxW$ and $maxH$ be variables specifying maximum values of the location components x_N , x_W , and y_N , y_W , respectively. $maxW$ and $maxH$ are derived as follows.

- If this process is invoked for neighbouring luma locations,

$$maxW = maxH = 16 \quad (6-33)$$

- Otherwise (this process is invoked for neighbouring chroma locations),

$$maxW = MbWidthC \quad (6-34)$$

$$maxH = MbHeightC \quad (6-35)$$

Depending on the variable $MbaffFrameFlag$, the neighbouring locations are derived as follows.

- If $MbaffFrameFlag$ is equal to 0, the specification for neighbouring locations in fields and non-MBAFF frames as described in subclause 6.4.9.1 is applied.
- Otherwise ($MbaffFrameFlag$ is equal to 1), the specification for neighbouring locations in MBAFF frames as described in subclause 6.4.9.2 is applied.

6.4.9.1 Specification for neighbouring locations in fields and non-MBAFF frames

The specifications in this subclause are applied when $MbaffFrameFlag$ is equal to 0.

The derivation process for neighbouring macroblock addresses and their availability in subclause 6.4.6 is invoked with $mbAddrA$, $mbAddrB$, $mbAddrC$, and $mbAddrD$ as well as their availability status as the output.

Table 6-3 specifies $mbAddrN$ depending on (x_N , y_N).

Table 6-3 – Specification of $mbAddrN$

x_N	y_N	$mbAddrN$
< 0	< 0	$mbAddrD$
< 0	$0 \dots maxH - 1$	$mbAddrA$
$0 \dots maxW - 1$	< 0	$mbAddrB$
$0 \dots maxW - 1$	$0 \dots maxH - 1$	$CurrMbAddr$
$> maxW - 1$	< 0	$mbAddrC$
$> maxW - 1$	$0 \dots maxH - 1$	not available
	$> maxH - 1$	not available

The neighbouring location (xW , yW) relative to the upper-left corner of the macroblock $mbAddrN$ is derived as

$$xW = (xN + \max W) \% \max W \quad (6-36)$$

$$yW = (yN + \max H) \% \max H \quad (6-37)$$

6.4.9.2 Specification for neighbouring locations in MBAFF frames

The specifications in this subclause are applied when $MbaffFrameFlag$ is equal to 1.

The derivation process for neighbouring macroblock addresses and their availability in subclause 6.4.7 is invoked with $mbAddrA$, $mbAddrB$, $mbAddrC$, and $mbAddrD$ as well as their availability status as the output.

Table 6-4 specifies the macroblock addresses $mbAddrN$ and yM in two ordered steps:

1. Specification of a macroblock address $mbAddrX$ depending on (xN , yN) and the following variables:
 - The variable $currMbFrameFlag$ is derived as follows.
 - If the macroblock with address $CurrMbAddr$ is a frame macroblock, $currMbFrameFlag$ is set equal to 1,
 - Otherwise (the macroblock with address $CurrMbAddr$ is a field macroblock), $currMbFrameFlag$ is set equal to 0.
 - The variable $mbIsTopMbFlag$ is derived as follows.
 - If the macroblock with address $CurrMbAddr$ is a top macroblock ($CurrMbAddr \% 2$ is equal to 0), $mbIsTopMbFlag$ is set equal to 1;
 - Otherwise (the macroblock with address $CurrMbAddr$ is a bottom macroblock, $CurrMbAddr \% 2$ is equal to 1), $mbIsTopMbFlag$ is set equal to 0.
2. Depending on the availability of $mbAddrX$, the following applies.
 - If $mbAddrX$ is not available, $mbAddrN$ is marked as not available.
 - Otherwise ($mbAddrX$ is available), $mbAddrN$ is marked as available and Table 6-4 specifies $mbAddrN$ and yM depending on (xN , yN), $currMbFrameFlag$, $mbIsTopMbFlag$, and the variable $mbAddrXFrameFlag$, which is derived as follows.
 - If the macroblock $mbAddrX$ is a frame macroblock, $mbAddrXFrameFlag$ is set equal to 1,
 - Otherwise (the macroblock $mbAddrX$ is a field macroblock), $mbAddrXFrameFlag$ is set equal to 0.

Unspecified values (na) of the above flags in Table 6-4 indicate that the value of the corresponding flag is not relevant for the current table rows.

Table 6-4 - Specification of mbAddrN and yM

x_N	y_N	currMbFrameFlag	mbIsTopMbFlag	mbAddrX	mbAddrXFrameFlag	additional condition	mbAddrN	y_M
< 0	< 0	1	1	mbAddrD			mbAddrD + 1	y_N
			0	mbAddrA	1		mbAddrA	y_N
		0	1	mbAddrD	0		mbAddrA + 1	$(y_N + \text{maxH}) \gg 1$
			0	mbAddrD	0		mbAddrD + 1	$2 * y_N$
< 0	0 .. maxH - 1	1	1	mbAddrA	1		mbAddrA	y_N
					0	$y_N \% 2 == 0$	mbAddrA	$y_N \gg 1$
					0	$y_N \% 2 != 0$	mbAddrA + 1	$y_N \gg 1$
			0	mbAddrA	1		mbAddrA + 1	y_N
					0	$y_N \% 2 == 0$	mbAddrA	$(y_N + \text{maxH}) \gg 1$
					0	$y_N \% 2 != 0$	mbAddrA + 1	$(y_N + \text{maxH}) \gg 1$
		0	1	mbAddrA	1	$y_N < (\text{maxH} / 2)$	mbAddrA	$y_N \ll 1$
					0	$y_N \geq (\text{maxH} / 2)$	mbAddrA + 1	$(y_N \ll 1) - \text{maxH}$
0 .. maxW - 1	< 0	1	1	mbAddrB	1		mbAddrB + 1	$2 * y_N$
			0	CurrMbAddr	0		mbAddrB	y_N
		0	1	mbAddrB	1		mbAddrB + 1	y_N
			0	mbAddrB	0		mbAddrB + 1	y_N
0 .. maxW - 1	0 .. maxH - 1			CurrMbAddr			CurrMbAddr	y_N
> maxW - 1	< 0	1	1	mbAddrC	1		mbAddrC + 1	y_N
			0	not available			not available	na
		0	1	mbAddrC	1		mbAddrC + 1	$2 * y_N$
			0	mbAddrC	0		mbAddrC	y_N
> maxW - 1	0 .. maxH - 1			not available			not available	na
	> maxH - 1			not available			not available	na

The neighbouring luma location (x_W , y_W) relative to the upper-left corner of the macroblock mbAddrN is derived as

$$x_W = (x_N + \text{maxW}) \% \text{maxW} \quad (6-38)$$

$$y_W = (y_M + \text{maxH}) \% \text{maxH} \quad (6-39)$$

7 Syntax and semantics

7.1 Method of describing syntax in tabular form

The syntax tables describe a superset of the syntax of all allowed input bitstreams. Additional constraints on the syntax may be specified in other clauses.

NOTE - An actual decoder should implement means for identifying entry points into the bitstream and to identify and handle non-conforming bitstreams. The methods for identifying and handling errors and other such situations are not described here.

The following table lists examples of pseudo code used to describe the syntax. When **syntax_element** appears, it specifies that a syntax element is parsed from the bitstream and the bitstream pointer is advanced to the next position beyond the syntax element in the bitstream parsing process.

/* A “while” structure specifies a test of whether a condition is true, and if true, specifies evaluation of a statement (or compound statement) repeatedly until the condition is no longer true */		
while(condition)		
statement		
/* A “do ... while” structure specifies evaluation of a statement once, followed by a test of whether a condition is true, and if true, specifies repeated evaluation of the statement until the condition is no longer true */		
do		
statement		
while(condition)		
/* An “if ... else” structure specifies a test of whether a condition is true, and if the condition is true, specifies evaluation of a primary statement, otherwise, specifies evaluation of an alternative statement. The “else” part of the structure and the associated alternative statement is omitted if no alternative statement evaluation is needed */		
if(condition)		
primary statement		
else		
alternative statement		
/* A “for” structure specifies evaluation of an initial statement, followed by a test of a condition, and if the condition is true, specifies repeated evaluation of a primary statement followed by a subsequent statement until the condition is no longer true. */		
for(initial statement; condition; subsequent statement)		
primary statement		

7.2 Specification of syntax functions, categories, and descriptors

The functions presented here are used in the syntactical description. These functions assume the existence of a bitstream pointer with an indication of the position of the next bit to be read by the decoding process from the bitstream.

`byte_aligned()` is specified as follows.

- If the current position in the bitstream is on a byte boundary, i.e., the next bit in the bitstream is the first bit in a byte, the return value of `byte_aligned()` is equal to TRUE.
- Otherwise, the return value of `byte_aligned()` is equal to FALSE.

`more_data_in_byte_stream()`, which is used only in the byte stream NAL unit syntax structure specified in Annex B, is specified as follows.

- If more data follow in the byte stream, the return value of `more_data_in_byte_stream()` is equal to TRUE.
- Otherwise, the return value of `more_data_in_byte_stream()` is equal to FALSE.

`more_rbsp_data()` is specified as follows.

- If there is more data in an RBSP before `rbsp_trailing_bits()`, the return value of `more_rbsp_data()` is equal to TRUE.
- Otherwise, the return value of `more_rbsp_data()` is equal to FALSE.

The method for enabling determination of whether there is more data in the RBSP is specified by the application (or in Annex B for applications that use the byte stream format).

`more_rbsp_trailing_data()` is specified as follows.

- If there is more data in an RBSP, the return value of `more_rbsp_trailing_data()` is equal to TRUE.
- Otherwise, the return value of `more_rbsp_trailing_data()` is equal to FALSE.

`next_bits(n)` provides the next bits in the bitstream for comparison purposes, without advancing the bitstream pointer. Provides a look at the next n bits in the bitstream with n being its argument. When used within the byte stream as specified in Annex B, `next_bits(n)` returns a value of 0 if fewer than n bits remain within the byte stream.

`read_bits(n)` reads the next n bits from the bitstream and advances the bitstream pointer by n bit positions. When n is equal to 0, `read_bits(n)` is specified to return a value equal to 0 and to not advance the bitstream pointer.

Categories (labelled in the table as C) specify the partitioning of slice data into at most three slice data partitions. Slice data partition A contains all syntax elements of category 2. Slice data partition B contains all syntax elements of category 3. Slice data partition C contains all syntax elements of category 4. The meaning of other category values is not specified. For some syntax elements, two category values, separated by a vertical bar, are used. In these cases, the category value to be applied is further specified in the text. For syntax structures used within other syntax structures, the categories of all syntax elements found within the included syntax structure are listed, separated by a vertical bar. A syntax element or syntax structure with category marked as "All" is present within all syntax structures that include that syntax element or syntax structure. For syntax structures used within other syntax structures, a numeric category value provided in a syntax table at the location of the inclusion of a syntax structure containing a syntax element with category marked as "All" is considered to apply to the syntax elements with category "All".

The following descriptors specify the parsing process of each syntax element. For some syntax elements, two descriptors, separated by a vertical bar, are used. In these cases, the left descriptors apply when `entropy_coding_mode_flag` is equal to 0 and the right descriptor applies when `entropy_coding_mode_flag` is equal to 1.

- `ae(v)`: context-adaptive arithmetic entropy-coded syntax element. The parsing process for this descriptor is specified in subclause 9.3.
- `b(8)`: byte having any pattern of bit string (8 bits). The parsing process for this descriptor is specified by the return value of the function `read_bits(8)`.
- `ce(v)`: context-adaptive variable-length entropy-coded syntax element with the left bit first. The parsing process for this descriptor is specified in subclause 9.2.
- `f(n)`: fixed-pattern bit string using n bits written (from left to right) with the left bit first. The parsing process for this descriptor is specified by the return value of the function `read_bits(n)`.
- `i(n)`: signed integer using n bits. When n is "v" in the syntax table, the number of bits varies in a manner dependent on the value of other syntax elements. The parsing process for this descriptor is specified by the return value of the function `read_bits(n)` interpreted as a two's complement integer representation with most significant bit written first.

- me(v): mapped Exp-Golomb-coded syntax element with the left bit first. The parsing process for this descriptor is specified in subclause 9.1.
- se(v): signed integer Exp-Golomb-coded syntax element with the left bit first. The parsing process for this descriptor is specified in subclause 9.1.
- te(v): truncated Exp-Golomb-coded syntax element with left bit first. The parsing process for this descriptor is specified in subclause 9.1.
- u(n): unsigned integer using n bits. When n is "v" in the syntax table, the number of bits varies in a manner dependent on the value of other syntax elements. The parsing process for this descriptor is specified by the return value of the function read_bits(n) interpreted as a binary representation of an unsigned integer with most significant bit written first.
- ue(v): unsigned integer Exp-Golomb-coded syntax element with the left bit first. The parsing process for this descriptor is specified in subclause 9.1.

7.3 Syntax in tabular form

7.3.1 NAL unit syntax

7.4 Semantics

7.4.1 NAL unit semantics

NOTE - The VCL is specified to efficiently represent the content of the video data. The NAL is specified to format that data and provide header information in a manner appropriate for conveyance on a variety of communication channels or storage media. All data are contained in NAL units, each of which contains an integer number of bytes. A NAL unit specifies a generic format for use in both packet-oriented and bitstream systems. The format of NAL units for both packet-oriented transport and byte stream is identical except that each NAL unit can be preceded by a start code prefix and extra padding bytes in the byte stream format.

NumBytesInNALunit specifies the size of the NAL unit in bytes. This value is required for decoding of the NAL unit. Some form of demarcation of NAL unit boundaries is necessary to enable inference of NumBytesInNALunit. One such demarcation method is specified in Annex B for the byte stream format. Other methods of demarcation may be specified outside of this Recommendation | International Standard.

forbidden_zero_bit shall be equal to 0.

nal_ref_idc not equal to 0 specifies that the content of the NAL unit contains a sequence parameter set or a picture parameter set or a slice of a reference picture or a slice data partition of a reference picture.

nal_ref_idc equal to 0 for a NAL unit containing a slice or slice data partition indicates that the slice or slice data partition is part of a non-reference picture.

nal_ref_idc shall not be equal to 0 for sequence parameter set or sequence parameter set extension or picture parameter set NAL units. When **nal_ref_idc** is equal to 0 for one slice or slice data partition NAL unit of a particular picture, it shall be equal to 0 for all slice and slice data partition NAL units of the picture.

nal_ref_idc shall not be equal to 0 for IDR NAL units, i.e., NAL units with **nal_unit_type** equal to 5.

nal_ref_idc shall be equal to 0 for all NAL units having **nal_unit_type** equal to 6, 9, 10, 11, or 12.

nal_unit_type specifies the type of RBSP data structure contained in the NAL unit as specified in Table 7-1. VCL NAL units are specified as those NAL units having **nal_unit_type** equal to 1 to 5, inclusive. All remaining NAL units are called non-VCL NAL units.

The column marked "C" in Table 7-1 lists the categories of the syntax elements that may be present in the NAL unit. In addition, syntax elements with syntax category "All" may be present, as determined by the syntax and semantics of the RBSP data structure. The presence or absence of any syntax elements of a particular listed category is determined from the syntax and semantics of the associated RBSP data structure. **nal_unit_type** shall not be equal to 3 or 4 unless at least one syntax element is present in the RBSP data structure having a syntax element category value equal to the value of **nal_unit_type** and not categorized as "All".

Table 7-1 – NAL unit type codes

nal_unit_type	Content of NAL unit and RBSP syntax structure	C
0	Unspecified	
1	Coded slice of a non-IDR picture slice_layer_without_partitioning_rbsp()	2, 3, 4
2	Coded slice data partition A slice_data_partition_a_layer_rbsp()	2
3	Coded slice data partition B slice_data_partition_b_layer_rbsp()	3
4	Coded slice data partition C slice_data_partition_c_layer_rbsp()	4
5	Coded slice of an IDR picture slice_layer_without_partitioning_rbsp()	2, 3
6	Supplemental enhancement information (SEI) sei_rbsp()	5
7	Sequence parameter set seq_parameter_set_rbsp()	0
8	Picture parameter set pic_parameter_set_rbsp()	1
9	Access unit delimiter access_unit_delimiter_rbsp()	6
10	End of sequence end_of_seq_rbsp()	7
11	End of stream end_of_stream_rbsp()	8
12	Filler data filler_data_rbsp()	9
13	Sequence parameter set extension seq_parameter_set_extension_rbsp()	10
14..18	Reserved	
19	Coded slice of an auxiliary coded picture without partitioning slice_layer_without_partitioning_rbsp()	2, 3, 4
20..23	Reserved	
24..31	Unspecified	

NAL units having nal_unit_type equal to 13 and 19 may be discarded by decoders without affecting the decoding process for NAL units having nal_unit_type not equal to 13 or 19 and without affecting conformance to this Recommendation | International Standard.

NAL units that use nal_unit_type equal to 0 or in the range of 24..31, inclusive, shall not affect the decoding process specified in this Recommendation | International Standard.

NOTE – NAL unit types 0 and 24..31 may be used as determined by the application. No decoding process for these values of nal_unit_type is specified in this Recommendation | International Standard.

Decoders shall ignore (remove from the bitstream and discard) the contents of all NAL units that use reserved values of nal_unit_type.

NOTE – This requirement allows future definition of compatible extensions to this Recommendation | International Standard.

In the text, coded slice NAL unit collectively refers to a coded slice of a non-IDR picture NAL unit or to a coded slice of an IDR picture NAL unit.

When the value of `nal_unit_type` is equal to 5 for a NAL unit containing a slice of a coded picture, the value of `nal_unit_type` shall be 5 in all other VCL NAL units of the same coded picture. Such a picture is referred to as an IDR picture.

NOTE – Slice data partitioning cannot be used for IDR pictures.

`rbsp_byte[ i ]` is the *i*-th byte of an RBSP. An RBSP is specified as an ordered sequence of bytes as follows.

The RBSP contains an SODB as follows.

- If the SODB is empty (i.e., zero bits in length), the RBSP is also empty.
- Otherwise, the RBSP contains the SODB as follows.
 - 1) The first byte of the RBSP contains the (most significant, left-most) eight bits of the SODB; the next byte of the RBSP shall contain the next eight bits of the SODB, etc., until fewer than eight bits of the SODB remain.
 - 2) `rbsp_trailing_bits( )` are present after the SODB as follows:
 - i) The first (most significant, left-most) bits of the final RBSP byte contains the remaining bits of the SODB, (if any)
 - ii) The next bit consists of a single `rbsp_stop_one_bit` equal to 1, and
 - iii) When the `rbsp_stop_one_bit` is not the last bit of a byte-aligned byte, one or more `rbsp_alignment_zero_bit` is present to result in byte alignment.
 - 3) One or more `cabac_zero_word` 16-bit syntax elements equal to 0x0000 may be present in some RBSPs after the `rbsp_trailing_bits( )` at the end of the RBSP.

Syntax structures having these RBSP properties are denoted in the syntax tables using an "_rbsp" suffix. These structures shall be carried within NAL units as the content of the `rbsp_byte[ i ]` data bytes. The association of the RBSP syntax structures to the NAL units shall be as specified in Table 7-1.

NOTE - When the boundaries of the RBSP are known, the decoder can extract the SODB from the RBSP by concatenating the bits of the bytes of the RBSP and discarding the `rbsp_stop_one_bit` which is the last (least significant, right-most) bit equal to 1, and discarding any following (less significant, farther to the right) bits that follow it, which are equal to 0. The data necessary for the decoding process is contained in the SODB part of the RBSP.

`emulation_prevention_three_byte` is a byte equal to 0x03. When an `emulation_prevention_three_byte` is present in the NAL unit, it shall be discarded by the decoding process.

The last byte of the NAL unit shall not be equal to 0x00.

Within the NAL unit, the following three-byte sequences shall not occur at any byte-aligned position:

- 0x000000
- 0x000001
- 0x000002

Within the NAL unit, any four-byte sequence that starts with 0x000003 other than the following sequences shall not occur at any byte-aligned position:

- 0x00000300
- 0x00000301
- 0x00000302
- 0x00000303

NOTE – When `nal_unit_type` is equal to 0, particular care must be exercised in the design of encoders to avoid the presence of the above-listed three-byte and four-byte patterns at the beginning of the NAL unit syntax structure, as the syntax element `emulation_prevention_three_byte` cannot be the third byte of a NAL unit.

7.4.1.1 Encapsulation of an SODB within an RBSP (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

The form of encapsulation of an SODB within an RBSP and the use of the emulation_prevention_three_byte for encapsulation of an RBSP within a NAL unit is specified for the following purposes:

- to prevent the emulation of start codes within NAL units while allowing any arbitrary SODB to be represented within a NAL unit,
- to enable identification of the end of the SODB within the NAL unit by searching the RBSP for the rbsp_stop_one_bit starting at the end of the RBSP, and
- to enable a NAL unit to have a size larger than that of the SODB under some circumstances (using one or more cabac_zero_word).

The encoder can produce a NAL unit from an RBSP by the following procedure:

The RBSP data is searched for byte-aligned bits of the following binary patterns:

'00000000 00000000 000000xx' (where xx represents any 2 bit pattern: 00, 01, 10, or 11),

and a byte equal to 0x03 is inserted to replace these bit patterns with the patterns

'00000000 00000000 00000011 000000xx',

and finally, when the last byte of the RBSP data is equal to 0x00 (which can only occur when the RBSP ends in a cabac_zero_word), a final byte equal to 0x03 is appended to the end of the data.

The resulting sequence of bytes is then prefixed with the first byte of the NAL unit containing the indication of the type of RBSP data structure it contains. This results in the construction of the entire NAL unit.

This process can allow any SODB to be represented in a NAL unit while ensuring that

- no byte-aligned start code prefix is emulated within the NAL unit, and
- no sequence of 8 zero-valued bits followed by a start code prefix, regardless of byte-alignment, is emulated within the NAL unit.

7.4.1.2 Order of NAL units and association to coded pictures, access units, and video sequences

This subclause specifies constraints on the order of NAL units in the bitstream. Any order of NAL units in the bitstream obeying these constraints is referred to in the text as the decoding order of NAL units. Within a NAL unit, the syntax in subclauses 7.3, D.1, and E.1 specifies the decoding order of syntax elements. Decoders conforming to this Recommendation | International Standard shall be capable of receiving NAL units and their syntax elements in decoding order.

7.4.1.2.1 Order of sequence and picture parameter set RBSPs and their activation

NOTE – The sequence and picture parameter set mechanism decouples the transmission of infrequently changing information from the transmission of coded macroblock data. Sequence and picture parameter sets may, in some applications, be conveyed "out-of-band" using a reliable transport mechanism.

A picture parameter set RBSP includes parameters that can be referred to by the coded slice NAL units or coded slice data partition A NAL units of one or more coded pictures. Each picture parameter set RBSP is initially considered not active at the start of the operation of the decoding process. At most one picture parameter set RBSP is considered active at any given moment during the operation of the decoding process, and the activation of any particular picture parameter set RBSP results in the deactivation of the previously-active picture parameter set RBSP (if any).

When a picture parameter set RBSP (with a particular value of pic_parameter_set_id) is not active and it is referred to by a coded slice NAL unit or coded slice data partition A NAL unit (using that value of pic_parameter_set_id), it is activated. This picture parameter set RBSP is called the active picture parameter set RBSP until it is deactivated by the activation of another picture parameter set RBSP. A picture parameter set RBSP, with that particular value of pic_parameter_set_id, shall be available to the decoding process prior to its activation.

Any picture parameter set NAL unit containing the value of pic_parameter_set_id for the active picture parameter set RBSP shall have the same content as that of the active picture parameter set RBSP unless it follows the last VCL NAL unit of a coded picture and precedes the first VCL NAL unit of another coded picture.

A sequence parameter set RBSP includes parameters that can be referred to by one or more picture parameter set RBSPs or one or more SEI NAL units containing a buffering period SEI message. Each sequence parameter set RBSP is initially considered not active at the start of the operation of the decoding process. At most one sequence parameter set RBSP is considered active at any given moment during the operation of the decoding process, and the activation of any particular sequence parameter set RBSP results in the deactivation of the previously-active sequence parameter set RBSP (if any).

When a sequence parameter set RBSP (with a particular value of `seq_parameter_set_id`) is not already active and it is referred to by activation of a picture parameter set RBSP (using that value of `seq_parameter_set_id`) or is referred to by an SEI NAL unit containing a buffering period SEI message (using that value of `seq_parameter_set_id`), it is activated. This sequence parameter set RBSP is called the active sequence parameter set RBSP until it is deactivated by the activation of another sequence parameter set RBSP. A sequence parameter set RBSP, with that particular value of `seq_parameter_set_id`, shall be available to the decoding process prior to its activation. An activated sequence parameter set RBSP shall remain active for the entire coded video sequence.

NOTE – Because an IDR access unit begins a new coded video sequence and an activated sequence parameter set RBSP must remain active for the entire coded video sequence, a sequence parameter set RBSP can only be activated by a buffering period SEI message when the buffering period SEI message is part of an IDR access unit.

Any sequence parameter set NAL unit containing the value of `seq_parameter_set_id` for the active sequence parameter set RBSP shall have the same content as that of the active sequence parameter set RBSP unless it follows the last access unit of a coded video sequence and precedes the first VCL NAL unit and the first SEI NAL unit containing a buffering period SEI message (when present) of another coded video sequence.

NOTE – If picture parameter set RBSP or sequence parameter set RBSP are conveyed within the bitstream, these constraints impose an order constraint on the NAL units that contain the picture parameter set RBSP or sequence parameter set RBSP, respectively. Otherwise (picture parameter set RBSP or sequence parameter set RBSP are conveyed by other means not specified in this Recommendation | International Standard), they must be available to the decoding process in a timely fashion such that these constraints are obeyed.

When present, a sequence parameter set extension RBSP includes parameters having a similar function to those of a sequence parameter set RBSP. For purposes of establishing constraints on the syntax elements of the sequence parameter set extension RBSP and for purposes of determining activation of a sequence parameter set extension RBSP, the sequence parameter set extension RBSP shall be considered part of the preceding sequence parameter set RBSP with the same value of `seq_parameter_set_id`. When a sequence parameter set RBSP is present that is not followed by a sequence parameter set extension RBSP with the same value of `seq_parameter_set_id` prior to the activation of the sequence parameter set RBSP, the sequence parameter set extension RBSP and its syntax elements shall be considered not present for the active sequence parameter set RBSP.

All constraints that are expressed on the relationship between the values of the syntax elements (and the values of variables derived from those syntax elements) in sequence parameter sets and picture parameter sets and other syntax elements are expressions of constraints that apply only to the active sequence parameter set and the active picture parameter set. If any sequence parameter set RBSP is present that is not activated in the bitstream, its syntax elements shall have values that would conform to the specified constraints if it were activated by reference in an otherwise-conforming bitstream. If any picture parameter set RBSP is present that is not ever activated in the bitstream, its syntax elements shall have values that would conform to the specified constraints if it were activated by reference in an otherwise-conforming bitstream.

During operation of the decoding process (see clause 8), the values of parameters of the active picture parameter set and the active sequence parameter set shall be considered in effect. For interpretation of SEI messages, the values of the parameters of the picture parameter set and sequence parameter set that are active for the operation of the decoding process for the VCL NAL units of the primary coded picture in the same access unit shall be considered in effect unless otherwise specified in the SEI message semantics.

7.4.1.2.2 Order of access units and association to coded video sequences

A bitstream conforming to this Recommendation | International Standard consists of one or more coded video sequences.

A coded video sequence consists of one or more access units. The order of NAL units and coded pictures and their association to access units is described in subclause 7.4.1.2.3.

The first access unit of each coded video sequence is an IDR access unit. All subsequent access units in the coded video sequence are non-IDR access units.

The values of picture order count for the coded pictures in consecutive access units in decoding order containing non-reference pictures shall be non-decreasing.

When present, an access unit following an access unit that contains an end of sequence NAL unit shall be an IDR access unit.

When an SEI NAL unit contains data that pertain to more than one access unit (for example, when the SEI NAL unit has a coded video sequence as its scope), it shall be contained in the first access unit to which it applies.

When an end of stream NAL unit is present in an access unit, this access unit shall be the last access unit in the bitstream and the end of stream NAL unit shall be the last NAL unit in that access unit.

7.4.1.2.3 Order of NAL units and coded pictures and association to access units

An access unit consists of one primary coded picture, zero or more corresponding redundant coded pictures, and zero or more non-VCL NAL units. The association of VCL NAL units to primary or redundant coded pictures is described in subclause 7.4.1.2.5.

The first access unit in the bitstream starts with the first NAL unit of the bitstream.

The first of any of the following NAL units after the last VCL NAL unit of a primary coded picture specifies the start of a new access unit.

- access unit delimiter NAL unit (when present)
- sequence parameter set NAL unit (when present)
- picture parameter set NAL unit (when present)
- SEI NAL unit (when present)
- NAL units with nal_unit_type in the range of 14 to 18, inclusive
- first VCL NAL unit of a primary coded picture (always present)

The constraints for the detection of the first VCL NAL unit of a primary coded picture are specified in subclause 7.4.1.2.4.

The following constraints shall be obeyed by the order of the coded pictures and non-VCL NAL units within an access unit.

- When an access unit delimiter NAL unit is present, it shall be the first NAL unit. There shall be at most one access unit delimiter NAL unit in any access unit.
- When any SEI NAL units are present, they shall precede the primary coded picture.
- When an SEI NAL unit containing a buffering period SEI message is present, the buffering period SEI message shall be the first SEI message payload of the first SEI NAL unit in the access unit
- The primary coded picture shall precede the corresponding redundant coded pictures.
- When redundant coded pictures are present, they shall be ordered in ascending order of the value of redundant_pic_cnt.
- When a sequence parameter set extension NAL unit is present, it shall be the next NAL unit after a sequence parameter set NAL unit having the same value of seq_parameter_set_id as in the sequence parameter set extension NAL unit.
- When one or more coded slice of an auxiliary coded picture without partitioning NAL units is present, they shall follow the primary coded picture and all redundant coded pictures (if any).
- When an end of sequence NAL unit is present, it shall follow the primary coded picture and all redundant coded pictures (if any) and all coded slice of an auxiliary coded picture without partitioning NAL units (if any).
- When an end of stream NAL unit is present, it shall be the last NAL unit.
- NAL units having nal_unit_type equal to 0, 12, or in the range of 20 to 31, inclusive, shall not precede the first VCL NAL unit of the primary coded picture.

NOTE – Sequence parameter set NAL units or picture parameter set NAL units may be present in an access unit, but cannot follow the last VCL NAL unit of the primary coded picture within the access unit, as this condition would specify the start of a new access unit.

NOTE – When a NAL unit having nal_unit_type equal to 7 or 8 is present in an access unit, it may or may not be referred to in the coded pictures of the access unit in which it is present, and may be referred to in coded pictures of subsequent access units.

The structure of access units not containing any NAL units with nal_unit_type equal to 0, 7, 8, or in the range of 12 to 18, inclusive, or in the range of 20 to 31, inclusive, is shown in Figure 7-1.

Figure 7-1 – Structure of an access unit not containing any NAL units with `nal_unit_type` equal to 0, 7, 8, or in the range of 12 to 18, inclusive, or in the range of 20 to 31, inclusive.

7.4.1.2.4 Detection of the first VCL NAL unit of a primary coded picture

This subclause specifies constraints on VCL NAL unit syntax that are sufficient to enable the detection of the first VCL NAL unit of each primary coded picture.

Any coded slice NAL unit or coded slice data partition A NAL unit of the primary coded picture of the current access unit shall be different from any coded slice NAL unit or coded slice data partition A NAL unit of the primary coded picture of the previous access unit in one or more of the following ways.

- `frame_num` differs in value. The value of `frame_num` used to test this condition is the value of `frame_num` that appears in the syntax of the slice header, regardless of whether that value is inferred to have been equal to 0 for subsequent use in the decoding process due to the presence of `memory_management_control_operation` equal to 5.

NOTE : A consequence of the above statement is that a primary coded picture having `frame_num` equal to 1 cannot contain a `memory_management_control_operation` equal to 5 unless some other condition listed below is fulfilled for the next primary coded picture that follows after it (if any).

- `pic_parameter_set_id` differs in value.

- field_pic_flag differs in value.
- bottom_field_flag is present in both and differs in value.
- nal_ref_idc differs in value with one of the nal_ref_idc values being equal to 0.
- pic_order_cnt_type is equal to 0 for both and either pic_order_cnt_lsb differs in value, or delta_pic_order_cnt_bottom differs in value.
- pic_order_cnt_type is equal to 1 for both and either delta_pic_order_cnt[0] differs in value, or delta_pic_order_cnt[1] differs in value.
- nal_unit_type differs in value with one of the nal_unit_type values being equal to 5.
- nal_unit_type is equal to 5 for both and idr_pic_id differs in value.

NOTE – Some of the VCL NAL units in redundant coded pictures or some non-VCL NAL units (e.g. an access unit delimiter NAL unit) may also be used for the detection of the boundary between access units, and may therefore aid in the detection of the start of a new primary coded picture.

7.4.1.2.5 Order of VCL NAL units and association to coded pictures

Each VCL NAL unit is part of a coded picture.

The order of the VCL NAL units within a coded IDR picture is constrained as follows.

- If arbitrary slice order is allowed as specified in Annex A, coded slice of an IDR picture NAL units may have any order relative to each other.
- Otherwise (arbitrary slice order is not allowed), the order of coded slice of an IDR picture NAL units shall be in the order of increasing macroblock address for the first macroblock of each coded slice of an IDR picture NAL unit.

The order of the VCL NAL units within a coded non-IDR picture is constrained as follows.

- If arbitrary slice order is allowed as specified in Annex A, coded slice of a non-IDR picture NAL units or coded slice data partition A NAL units may have any order relative to each other. A coded slice data partition A NAL unit with a particular value of slice_id shall precede any present coded slice data partition B NAL unit with the same value of slice_id. A coded slice data partition A NAL unit with a particular value of slice_id shall precede any present coded slice data partition C NAL unit with the same value of slice_id. When a coded slice data partition B NAL unit with a particular value of slice_id is present, it shall precede any present coded slice data partition C NAL unit with the same value of slice_id.
- Otherwise (arbitrary slice order is not allowed), the order of coded slice of a non-IDR picture NAL units or coded slice data partition A NAL units shall be in the order of increasing macroblock address for the first macroblock of each coded slice of a non-IDR picture NAL unit or coded slice data partition A NAL unit. A coded slice data partition A NAL unit with a particular value of slice_id shall immediately precede any present coded slice data partition B NAL unit with the same value of slice_id. A coded slice data partition A NAL unit with a particular value of slice_id shall immediately precede any present coded slice data partition C NAL unit with the same value of slice_id, when a coded slice data partition B NAL unit with the same value of slice_id is not present. When a coded slice data partition B NAL unit with a particular value of slice_id is present, it shall immediately precede any present coded slice data partition C NAL unit with the same value of slice_id.

NAL units having nal_unit_type equal to 12 may be present in the access unit but shall not precede the first VCL NAL unit of the primary coded picture within the access unit.

NAL units having nal_unit_type equal to 0 or in the range of 24 to 31, inclusive, which are unspecified, may be present in the access unit but shall not precede the first VCL NAL unit of the primary coded picture within the access unit.

NAL units having nal_unit_type in the range of 20 to 23, inclusive, which are reserved, shall not precede the first VCL NAL unit of the primary coded picture within the access unit (when specified in the future by ITU-T | ISO/IEC).

7.4.2 Raw byte sequence payloads and RBSP trailing bits semantics

7.4.2.1 Sequence parameter set RBSP semantics

profile_idc and level_idc indicate the profile and level to which the bitstream conforms, as specified in Annex A.

constraint_set0_flag equal to 1 indicates that the bitstream obeys all constraints specified in subclause A.2.1
constraint_set0_flag equal to 0 indicates that the bitstream may or may not obey all constraints specified in subclause A.2.1.

constraint_set1_flag equal to 1 indicates that the bitstream obeys all constraints specified in subclause A.2.2
constraint_set1_flag equal to 0 indicates that the bitstream may or may not obey all constraints specified in subclause A.2.2.

constraint_set2_flag equal to 1 indicates that the bitstream obeys all constraints specified in subclause A.2.3
constraint_set2_flag equal to 0 indicates that the bitstream may or may not obey all constraints specified in subclause A.2.3.

NOTE – When more than one of **constraint_set0_flag**, **constraint_set1_flag**, or **constraint_set2_flag** are equal to 1, the bitstream obeys the constraints of all of the indicated subclauses of subclause A.2.

constraint_set3_flag indicates the following.

- If **profile_idc** is equal to 66, 77, or 88 and **level_idc** is equal to 11, **constraint_set3_flag** equal to 1 indicates that the bitstream obeys all constraints specified in Annex A for level 1b and **constraint_set3_flag** equal to 0 indicates that the bitstream may or may not obey all constraints specified in Annex A for level 1b.
- Otherwise (**profile_idc** is equal to 100, 110, 122, or 144 or **level_idc** is not equal to 11), the value of 1 for **constraint_set3_flag** is reserved for future use by ITU-T | ISO/IEC. **constraint_set3_flag** shall be equal to 0 in bitstreams conforming to this Recommendation | International Standard when **profile_idc** is equal to 100, 110, 122, or 144 or **level_idc** is not equal to 11. Decoders conforming to this Recommendation | International Standard shall ignore the value of **constraint_set3_flag** when **profile_idc** is equal to 100, 110, 122, or 144 or **level_idc** is not equal to 11.

reserved_zero_4bits shall be equal to 0. Other values of **reserved_zero_4bits** may be specified in the future by ITU-T | ISO/IEC. Decoders shall ignore the value of **reserved_zero_4bits**.

seq_parameter_set_id identifies the sequence parameter set that is referred to by the picture parameter set. The value of **seq_parameter_set_id** shall be in the range of 0 to 31, inclusive.

NOTE – When feasible, encoders should use distinct values of **seq_parameter_set_id** when the values of other sequence parameter set syntax elements differ rather than changing the values of the syntax elements associated with a specific value of **seq_parameter_set_id**.

chroma_format_idc specifies the chroma sampling relative to the luma sampling as specified in subclause 6.2. The value of **chroma_format_idc** shall be in the range of 0 to 3, inclusive. When **chroma_format_idc** is not present, it shall be inferred to be equal to 1 (4:2:0 chroma format).

residual_colour_transform_flag equal to 1 specifies that the residual colour transform is applied as specified in subclause 8.5. **residual_colour_transform_flag** equal to 0 specifies that the residual colour transform is not applied. When **residual_colour_transform_flag** is not present, it shall be inferred to be equal to 0.

bit_depth_luma_minus8 specifies the bit depth of the samples of the luma array and the value of the luma quantisation parameter range offset $QpBdOffset_Y$, as specified by

$$BitDepth_Y = 8 + bit_depth_luma_minus8 \quad (7-1)$$

$$QpBdOffset_Y = 6 * bit_depth_luma_minus8 \quad (7-2)$$

When **bit_depth_luma_minus8** is not present, it shall be inferred to be equal to 0. **bit_depth_luma_minus8** shall be in the range of 0 to 4, inclusive.

bit_depth_chroma_minus8 specifies the bit depth of the samples of the chroma arrays and the value of the chroma quantisation parameter range offset $QpBdOffset_C$, as specified by

$$BitDepth_C = 8 + bit_depth_chroma_minus8 \quad (7-3)$$

$$QpBdOffset_C = 6 * (bit_depth_chroma_minus8 + residual_colour_transform_flag) \quad (7-4)$$

When **bit_depth_chroma_minus8** is not present, it shall be inferred to be equal to 0. **bit_depth_chroma_minus8** shall be in the range of 0 to 4, inclusive.

The variable **RawMbBits** is derived as

$$RawMbBits = 256 * BitDepth_Y + 2 * MbWidthC * MbHeightC * BitDepth_C \quad (7-5)$$

qpprime_y_zero_transform_bypass_flag equal to 1 specifies that, when QP'_Y is equal to 0, a transform bypass operation for the transform coefficient decoding process and picture construction process prior to deblocking filter process as specified in subclause 8.5 shall be applied. **qpprime_y_zero_transform_bypass_flag** equal to 0 specifies that the transform coefficient decoding process and picture construction process prior to deblocking filter process shall not use the transform bypass operation. When **qpprime_y_zero_transform_bypass_flag** is not present, it shall be inferred to be equal to 0.

seq_scaling_matrix_present_flag equal to 1 specifies that the flags **seq_scaling_list_present_flag[i]** for $i = 0..7$ are present. **seq_scaling_matrix_present_flag** equal to 0 specifies that these flags are not present and the sequence-level scaling list specified by **Flat_4x4_16** shall be inferred for $i = 0..5$ and the sequence-level scaling list specified by **Flat_8x8_16** shall be inferred for $i = 6..7$. When **seq_scaling_matrix_present_flag** is not present, it shall be inferred to be equal to 0.

The scaling lists **Flat_4x4_16** and **Flat_8x8_16** are specified as follows:

$$\text{Flat_4x4_16}[i] = 16, \quad \text{with } i = 0..15, \quad (7-6)$$

$$\text{Flat_8x8_16}[i] = 16, \quad \text{with } i = 0..63. \quad (7-7)$$

seq_scaling_list_present_flag[i] equal to 1 specifies that the syntax structure for scaling list i is present in the sequence parameter set. **seq_scaling_list_present_flag[i]** equal to 0 specifies that the syntax structure for scaling list i is not present in the sequence parameter set and the scaling list fall-back rule set A specified in Table 7-2 shall be used to infer the sequence-level scaling list for index i .

Table 7-2 – Assignment of mnemonic names to scaling list indices and specification of fall-back rule

Value of scaling list index	Mnemonic name	Block size	MB prediction type	Component	Scaling list fall-back rule set A	Scaling list fall-back rule set B	Default scaling list
0	Sl_4x4_Intra_Y	4x4	Intra	Y	default scaling list	sequence-level scaling list	Default_4x4_Intra
1	Sl_4x4_Intra_Cb	4x4	Intra	Cb	scaling list for $i = 0$	scaling list for $i = 0$	Default_4x4_Intra
2	Sl_4x4_Intra_Cr	4x4	Intra	Cr	scaling list for $i = 1$	scaling list for $i = 1$	Default_4x4_Intra
3	Sl_4x4_Inter_Y	4x4	Inter	Y	default scaling list	sequence-level scaling list	Default_4x4_Inter
4	Sl_4x4_Inter_Cb	4x4	Inter	Cb	scaling list for $i = 3$	scaling list for $i = 3$	Default_4x4_Inter
5	Sl_4x4_Inter_Cr	4x4	Inter	Cr	scaling list for $i = 4$	scaling list for $i = 4$	Default_4x4_Inter
6	Sl_8x8_Intra_Y	8x8	Intra	Y	default scaling list	sequence-level scaling list	Default_8x8_Intra
7	Sl_8x8_Inter_Y	8x8	Inter	Y	default scaling list	sequence-level scaling list	Default_8x8_Inter

Table 7-3 specifies the default scaling lists **Default_4x4_Intra** and **Default_4x4_Inter**. Table 7-4 specifies the default scaling lists **Default_8x8_Intra** and **Default_8x8_Inter**.

$\log_2_max_frame_num_minus4$ specifies the value of the variable MaxFrameNum that is used in frame_num related derivations as follows:

$$MaxFrameNum = 2^{(\log_2_max_frame_num_minus4 + 4)} \quad (7-8)$$

The value of $\log_2_max_frame_num_minus4$ shall be in the range of 0 to 12, inclusive.

pic_order_cnt_type specifies the method to decode picture order count (as specified in subclause 8.2.1). The value of pic_order_cnt_type shall be in the range of 0 to 2, inclusive.

pic_order_cnt_type shall not be equal to 2 in a coded video sequence that contains any of the following

- an access unit containing a non-reference frame followed immediately by an access unit containing a non-reference picture
- two access units each containing a field with the two fields together forming a complementary non-reference field pair followed immediately by an access unit containing a non-reference picture
- an access unit containing a non-reference field followed immediately by an access unit containing another non-reference picture that does not form a complementary non-reference field pair with the first of the two access units

log2_max_pic_order_cnt_lsb_minus4 specifies the value of the variable `MaxPicOrderCntLsb` that is used in the decoding process for picture order count as specified in subclause 8.2.1 as follows:

$$\text{MaxPicOrderCntLsb} = 2^{(\text{log2_max_pic_order_cnt_lsb_minus4} + 4)} \quad (7-9)$$

The value of `log2_max_pic_order_cnt_lsb_minus4` shall be in the range of 0 to 12, inclusive.

delta_pic_order_always_zero_flag equal to 1 specifies that `delta_pic_order_cnt[0]` and `delta_pic_order_cnt[1]` are not present in the slice headers of the sequence and shall be inferred to be equal to 0. `delta_pic_order_always_zero_flag` equal to 0 specifies that `delta_pic_order_cnt[0]` is present in the slice headers of the sequence and `delta_pic_order_cnt[1]` may be present in the slice headers of the sequence.

offset_for_non_ref_pic is used to calculate the picture order count of a non-reference picture as specified in 8.2.1. The value of `offset_for_non_ref_pic` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive.

offset_for_top_to_bottom_field is used to calculate the picture order count of the bottom field in a frame as specified in 8.2.1. The value of `offset_for_top_to_bottom_field` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive.

num_ref_frames_in_pic_order_cnt_cycle is used in the decoding process for picture order count as specified in subclause 8.2.1. The value of `num_ref_frames_in_pic_order_cnt_cycle` shall be in the range of 0 to 255, inclusive.

offset_for_ref_frame[i] is an element of a list of `num_ref_frames_in_pic_order_cnt_cycle` values used in the decoding process for picture order count as specified in subclause 8.2.1. The value of `offset_for_ref_frame[i]` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive.

num_ref_frames specifies the maximum number of short-term and long-term reference frames, complementary reference field pairs, and non-paired reference fields that may be used by the decoding process for inter prediction of any picture in the sequence. `num_ref_frames` also determines the size of the sliding window operation as specified in subclause 8.2.5.3. The value of `num_ref_frames` shall be in the range of 0 to `MaxDpbSize` (as specified in subclause A.3.1 or A.3.2), inclusive.

gaps_in_frame_num_value_allowed_flag specifies the allowed values of `frame_num` as specified in subclause 7.4.3 and the decoding process in case of an inferred gap between values of `frame_num` as specified in subclause 8.2.5.2.

pic_width_in_mbs_minus1 plus 1 specifies the width of each decoded picture in units of macroblocks.

The variable for the picture width in units of macroblocks is derived as follows

$$\text{PicWidthInMbs} = \text{pic_width_in_mbs_minus1} + 1 \quad (7-10)$$

The variable for picture width for the luma component is derived as follows

$$\text{PicWidthInSamples}_L = \text{PicWidthInMbs} * 16 \quad (7-11)$$

The variable for picture width for the chroma components is derived as follows

$$\text{PicWidthInSamples}_C = \text{PicWidthInMbs} * \text{MbWidthC} \quad (7-12)$$

pic_height_in_map_units_minus1 plus 1 specifies the height in slice group map units of a decoded frame or field.

The variables `PicHeightInMapUnits` and `PicSizeInMapUnits` are derived as follows

$$\text{PicHeightInMapUnits} = \text{pic_height_in_map_units_minus1} + 1 \quad (7-13)$$

$$\text{PicSizeInMapUnits} = \text{PicWidthInMbs} * \text{PicHeightInMapUnits} \quad (7-14)$$

frame_mbs_only_flag equal to 0 specifies that coded pictures of the coded video sequence may either be coded fields or coded frames. `frame_mbs_only_flag` equal to 1 specifies that every coded picture of the coded video sequence is a coded frame containing only frame macroblocks.

The allowed range of values for `pic_width_in_mbs_minus1`, `pic_height_in_map_units_minus1`, and `frame_mbs_only_flag` is specified by constraints in Annex A.

Depending on `frame_mbs_only_flag`, semantics are assigned to `pic_height_in_map_units_minus1` as follows.

- If `frame_mbs_only_flag` is equal to 0, `pic_height_in_map_units_minus1` plus 1 is the height of a field in units of macroblocks.

- Otherwise (frame_mbs_only_flag is equal to 1), pic_height_in_map_units_minus1 plus 1 is the height of a frame in units of macroblocks.

The variable FrameHeightInMbs is derived as follows

$$\text{FrameHeightInMbs} = (2 - \text{frame_mbs_only_flag}) * \text{PicHeightInMapUnits} \quad (7-15)$$

mb_adaptive_frame_field_flag equal to 0 specifies no switching between frame and field macroblocks within a picture. **mb_adaptive_frame_field_flag** equal to 1 specifies the possible use of switching between frame and field macroblocks within frames. When **mb_adaptive_frame_field_flag** is not present, it shall be inferred to be equal to 0.

direct_8x8_inference_flag specifies the method used in the derivation process for luma motion vectors for B_Skip, B_Direct_16x16 and B_Direct_8x8 as specified in subclause 8.4.1.2. When **frame_mbs_only_flag** is equal to 0, **direct_8x8_inference_flag** shall be equal to 1.

frame_cropping_flag equal to 1 specifies that the frame cropping offset parameters follow next in the sequence parameter set. **frame_cropping_flag** equal to 0 specifies that the frame cropping offset parameters are not present.

frame_crop_left_offset, **frame_crop_right_offset**, **frame_crop_top_offset**, **frame_crop_bottom_offset** specify the samples of the pictures in the coded video sequence that are output from the decoding process, in terms of a rectangular region specified in frame coordinates for output.

The variables CropUnitX and CropUnitY are derived as follows:

- If **chroma_format_idc** is equal to 0, CropUnitX and CropUnitY are derived as

$$\text{CropUnitX} = 1 \quad (7-16)$$

$$\text{CropUnitY} = 2 - \text{frame_mbs_only_flag} \quad (7-17)$$

- Otherwise (**chroma_format_idc** is equal to 1, 2, or 3), CropUnitX and CropUnitY are derived as

$$\text{CropUnitX} = \text{SubWidthC} \quad (7-18)$$

$$\text{CropUnitY} = \text{SubHeightC} * (2 - \text{frame_mbs_only_flag}) \quad (7-19)$$

The frame cropping rectangle contains luma samples with horizontal frame coordinates from $\text{CropUnitX} * \text{frame_crop_left_offset}$ to $\text{PicWidthInSamples}_L - (\text{CropUnitX} * \text{frame_crop_right_offset} + 1)$ and vertical frame coordinates from $\text{CropUnitY} * \text{frame_crop_top_offset}$ to $(16 * \text{FrameHeightInMbs}) - (\text{CropUnitY} * \text{frame_crop_bottom_offset} + 1)$, inclusive. The value of **frame_crop_left_offset** shall be in the range of 0 to $(\text{PicWidthInSamples}_L / \text{CropUnitX}) - (\text{frame_crop_right_offset} + 1)$, inclusive; and the value of **frame_crop_top_offset** shall be in the range of 0 to $(16 * \text{FrameHeightInMbs} / \text{CropUnitY}) - (\text{frame_crop_bottom_offset} + 1)$, inclusive.

When **frame_cropping_flag** is equal to 0, the values of **frame_crop_left_offset**, **frame_crop_right_offset**, **frame_crop_top_offset**, and **frame_crop_bottom_offset** shall be inferred to be equal to 0.

When **chroma_format_idc** is not equal to 0, the corresponding specified samples of the two chroma arrays are the samples having frame coordinates $(x / \text{SubWidthC}, y / \text{SubHeightC})$, where (x, y) are the frame coordinates of the specified luma samples.

For decoded fields, the specified samples of the decoded field are the samples that fall within the rectangle specified in frame coordinates.

vui_parameters_present_flag equal to 1 specifies that the **vui_parameters()** syntax structure as specified in Annex E is present. **vui_parameters_present_flag** equal to 0 specifies that the **vui_parameters()** syntax structure as specified in Annex E is not present.

7.4.2.1.1 Scaling list semantics

delta_scale is used to derive the j-th element of the scaling list for j in the range of 0 to **sizeOfScalingList** - 1, inclusive. The value of **delta_scale** shall be in the range of -128 to +127, inclusive.

When **useDefaultScalingMatrixFlag** is derived to be equal to 1, the scaling list shall be inferred to be equal to the default scaling list as specified in Table 7-2.

7.4.2.1.2 Sequence parameter set extension RBSP semantics

seq_parameter_set_id identifies the sequence parameter set associated with the sequence parameter set extension. The value of **seq_parameter_set_id** shall be in the range of 0 to 31, inclusive.

aux_format_idc equal to 0 indicates that there are no auxiliary coded pictures in the coded video sequence. **aux_format_idc** equal to 1 indicates that exactly one auxiliary coded picture is present in each access unit of the coded video sequence, and that for alpha blending purposes the decoded samples of the associated primary coded picture in each access unit should be multiplied by the interpretation sample values of the auxiliary coded picture in the access unit in the display process after output from the decoding process. **aux_format_idc** equal to 2 indicates that exactly one auxiliary coded picture exists in each access unit of the coded video sequence, and that for alpha blending purposes the decoded samples of the associated primary coded picture in each access unit should not be multiplied by the interpretation sample values of the auxiliary coded picture in the access unit in the display process after output from the decoding process. **aux_format_idc** equal to 3 indicates that exactly one auxiliary coded picture exists in each access unit of the coded video sequence, and that the usage of the auxiliary coded pictures is unspecified. The value of **aux_format_idc** shall be in the range of 0 to 3, inclusive. Values greater than 3 for **aux_format_idc** are reserved to indicate the presence of exactly one auxiliary coded picture in each access unit of the coded video sequence for purposes to be specified in the future by ITU-T | ISO/IEC. When **aux_format_idc** is not present, it shall be inferred to be equal to 0.

NOTE – Decoders conforming to this Recommendation | International Standard are not required to decode auxiliary coded pictures.

bit_depth_aux_minus8 specifies the bit depth of the samples of the sample array of the auxiliary coded picture. **bit_depth_aux_minus8** shall be in the range of 0 to 4, inclusive.

alpha_incr_flag equal to 0 indicates that the interpretation sample value for each decoded auxiliary coded picture sample value is equal to the decoded auxiliary coded picture sample value for purposes of alpha blending. **alpha_incr_flag** equal to 1 indicates that, for purposes of alpha blending, after decoding the auxiliary coded picture samples, any auxiliary coded picture sample value that is greater than $\text{Min}(\text{alpha_opaque_value}, \text{alpha_transparent_value})$ should be increased by one to obtain the interpretation sample value for the auxiliary coded picture sample, and any auxiliary coded picture sample value that is less than or equal to $\text{Min}(\text{alpha_opaque_value}, \text{alpha_transparent_value})$ should be used without alteration as the interpretation sample value for the decoded auxiliary coded picture sample value.

alpha_opaque_value specifies the interpretation sample value of an auxiliary coded picture sample for which the associated luma and chroma samples of the same access unit are considered opaque for purposes of alpha blending. The number of bits used for the representation of the **alpha_opaque_value** syntax element is **bit_depth_aux_minus8** + 9 bits.

alpha_transparent_value specifies the interpretation sample value of an auxiliary coded picture sample for which the associated luma and chroma samples of the same access unit are considered transparent for purposes of alpha blending. The number of bits used for the representation of the **alpha_transparent_value** syntax element is **bit_depth_aux_minus8** + 9 bits.

When **alpha_incr_flag** is equal to 1, **alpha_transparent_value** shall not be equal to **alpha_opaque_value** and $\text{Log}_2(\text{Abs}(\text{alpha_opaque_value} - \text{alpha_transparent_value}))$ shall have an integer value. A value of **alpha_transparent_value** that is equal to **alpha_opaque_value** indicates that the auxiliary coded picture is not intended for alpha blending purposes.

NOTE – For alpha blending purposes, **alpha_opaque_value** may be greater than **alpha_transparent_value**, or it may be less than **alpha_transparent_value**. Interpretation sample values should be clipped to the range of **alpha_opaque_value** to **alpha_transparent_value**, inclusive.

The decoding of the sequence parameter set extension and the decoding of auxiliary coded pictures is not required for conformance with this Recommendation | International Standard.

The syntax of each coded slice of an auxiliary coded picture shall obey the same constraints as a coded slice of a redundant picture, with the following differences of constraints.

- The following applies in regard to whether the primary coded picture is an IDR picture.
 - If the primary coded picture is an IDR picture, the auxiliary coded slice syntax shall correspond to that of a slice having **nal_unit_type** equal to 5 (a slice of an IDR picture)
 - Otherwise (the primary coded picture is not an IDR picture), the auxiliary coded slice syntax shall correspond to that of a slice having **nal_unit_type** equal to 1 (a slice of a non-IDR picture).

- The slices of an auxiliary coded picture (when present) shall contain all macroblocks corresponding to those of the primary coded picture.
- `redundant_pic_cnt` shall be equal to 0 in all auxiliary coded slices.

The (optional) decoding process for the decoding of auxiliary coded pictures is the same as if the auxiliary coded pictures were primary coded pictures in a separate coded video stream that differs from the primary coded pictures in the current coded video stream in the following ways.

- The IDR or non-IDR status of each auxiliary coded picture shall be inferred to be the same as the IDR or non-IDR status of the primary picture in the same access unit, rather than being inferred from the value of `nal_ref_idc`.
- The value of `chroma_format_idc` shall be inferred to be equal to 0 for the decoding of the auxiliary coded pictures.
- The value of `bit_depth_luma_minus8` shall be inferred to be equal to `bit_depth_aux_minus8` for the decoding of the auxiliary coded pictures.

NOTE –Alpha blending composition is normally performed with a background picture B, a foreground picture F, and a decoded auxiliary coded picture A, all of the same size. Assume for purposes of example illustration that the chroma resolution of B and F have been upsampled to the same resolution as the luma. Denote corresponding samples of B, F and A by b , f and a , respectively. Denote luma and chroma samples by subscripts Y, Cb and Cr.

Define the variables `alphaRange`, `alphaFwt` and `alphaBwt` as follows:

$$\begin{aligned}\text{alphaRange} &= \text{Abs}(\text{alpha_opaque_value} - \text{alpha_transparent_value}) \\ \text{alphaFwt} &= \text{Abs}(a - \text{alpha_transparent_value}) \\ \text{alphaBwt} &= \text{Abs}(a - \text{alpha_opaque_value})\end{aligned}$$

Then, in alpha blending composition, samples d of the displayed picture D may be calculated as

$$\begin{aligned}d_Y &= (\text{alphaFwt} \cdot f_Y + \text{alphaBwt} \cdot b_Y + \text{alphaRange}/2) / \text{alphaRange} \\ d_{CB} &= (\text{alphaFwt} \cdot f_{CB} + \text{alphaBwt} \cdot b_{CB} + \text{alphaRange}/2) / \text{alphaRange} \\ d_{CR} &= (\text{alphaFwt} \cdot f_{CR} + \text{alphaBwt} \cdot b_{CR} + \text{alphaRange}/2) / \text{alphaRange}\end{aligned}$$

The samples of pictures D, F and B could also represent red, green, and blue component values (see subclause E.2.1). Here we have assumed Y, Cb and Cr component values. Each component, e.g. Y, is assumed for purposes of example illustration above to have the same bit depth in each of the pictures D, F and B. However, different components, e.g. Y and Cb, need not have the same bit depth in this example.

When `aux_format_idc` is equal to 1, F would be the decoded picture obtained from the decoded luma and chroma, and A would be the decoded picture obtained from the decoded auxiliary coded picture. In this case, the indicated example alpha blending composition involves multiplying the samples of F by factors obtained from the samples of A.

A picture format that is useful for editing or direct viewing, and that is commonly used, is called pre-multiplied-black video. If the foreground picture was F, then the pre-multiplied-black video S is given by

$$\begin{aligned}s_Y &= (\text{alphaFwt} \cdot f_Y) / \text{alphaRange} \\ s_{CB} &= (\text{alphaFwt} \cdot f_{CB}) / \text{alphaRange} \\ s_{CR} &= (\text{alphaFwt} \cdot f_{CR}) / \text{alphaRange}\end{aligned}$$

Pre-multiplied-black video has the characteristic that the picture S will appear correct if displayed against a black background. For a non-black background B, the composition of the displayed picture D may be calculated as

$$\begin{aligned}d_Y &= s_Y + (\text{alphaBwt} \cdot b_Y + \text{alphaRange}/2) / \text{alphaRange} \\ d_{CB} &= s_{CB} + (\text{alphaBwt} \cdot b_{CB} + \text{alphaRange}/2) / \text{alphaRange} \\ d_{CR} &= s_{CR} + (\text{alphaBwt} \cdot b_{CR} + \text{alphaRange}/2) / \text{alphaRange}\end{aligned}$$

When `aux_format_idc` is equal to 2, S would be the decoded picture obtained from the decoded luma and chroma, and A would again be the decoded picture obtained from the decoded auxiliary coded picture. In this case, alpha blending composition does not involve multiplication of the samples of S by factors obtained from the samples of A.

additional_extension_flag equal to 0 indicates that no additional data follows within the sequence parameter set extension syntax structure prior to the RBSP trailing bits. The value of `additional_extension_flag` shall be equal to 0. The value of 1 for `additional_extension_flag` is reserved for future use by ITU-T | ISO/IEC. Decoders that conform to this Recommendation | International Standard shall ignore all data that follows the value of 1 for `additional_extension_flag` in a sequence parameter set extension NAL unit.

7.4.2.2 Picture parameter set RBSP semantics

pic_parameter_set_id identifies the picture parameter set that is referred to in the slice header. The value of `pic_parameter_set_id` shall be in the range of 0 to 255, inclusive.

seq_parameter_set_id refers to the active sequence parameter set. The value of `seq_parameter_set_id` shall be in the range of 0 to 31, inclusive.

entropy_coding_mode_flag selects the entropy decoding method to be applied for the syntax elements for which two descriptors appear in the syntax tables as follows.

- If **entropy_coding_mode_flag** is equal to 0, the method specified by the left descriptor in the syntax table is applied (Exp-Golomb coded, see subclause 9.1 or CAVLC, see subclause 9.2).
- Otherwise (**entropy_coding_mode_flag** is equal to 1), the method specified by the right descriptor in the syntax table is applied (CABAC, see subclause 9.3).

pic_order_present_flag equal to 1 specifies that the picture order count related syntax elements are present in the slice headers as specified in subclause 7.3.3. **pic_order_present_flag** equal to 0 specifies that the picture order count related syntax elements are not present in the slice headers.

num_slice_groups_minus1 plus 1 specifies the number of slice groups for a picture. When **num_slice_groups_minus1** is equal to 0, all slices of the picture belong to the same slice group. The allowed range of **num_slice_groups_minus1** is specified in Annex A.

slice_group_map_type specifies how the mapping of slice group map units to slice groups is coded. The value of **slice_group_map_type** shall be in the range of 0 to 6, inclusive.

slice_group_map_type equal to 0 specifies interleaved slice groups.

slice_group_map_type equal to 1 specifies a dispersed slice group mapping.

slice_group_map_type equal to 2 specifies one or more “foreground” slice groups and a “leftover” slice group.

slice_group_map_type values equal to 3, 4, and 5 specify changing slice groups. When **num_slice_groups_minus1** is not equal to 1, **slice_group_map_type** shall not be equal to 3, 4, or 5.

slice_group_map_type equal to 6 specifies an explicit assignment of a slice group to each slice group map unit.

Slice group map units are specified as follows.

- If **frame_mbs_only_flag** is equal to 0 and **mb_adaptive_frame_field_flag** is equal to 1 and the coded picture is a frame, the slice group map units are macroblock pair units.
- Otherwise, if **frame_mbs_only_flag** is equal to 1 or a coded picture is a field, the slice group map units are units of macroblocks.
- Otherwise (**frame_mbs_only_flag** is equal to 0 and **mb_adaptive_frame_field_flag** is equal to 0 and the coded picture is a frame), the slice group map units are units of two macroblocks that are vertically contiguous as in a frame macroblock pair of an MBAFF frame.

run_length_minus1[i] is used to specify the number of consecutive slice group map units to be assigned to the i-th slice group in raster scan order of slice group map units. The value of **run_length_minus1[i]** shall be in the range of 0 to **PicSizeInMapUnits - 1**, inclusive.

top_left[i] and **bottom_right[i]** specify the top-left and bottom-right corners of a rectangle, respectively. **top_left[i]** and **bottom_right[i]** are slice group map unit positions in a raster scan of the picture for the slice group map units. For each rectangle i, all of the following constraints shall be obeyed by the values of the syntax elements **top_left[i]** and **bottom_right[i]**.

- **top_left[i]** shall be less than or equal to **bottom_right[i]** and **bottom_right[i]** shall be less than **PicSizeInMapUnits**.
- $(\text{top_left}[i] \% \text{PicWidthInMbs})$ shall be less than or equal to the value of $(\text{bottom_right}[i] \% \text{PicWidthInMbs})$.

slice_group_change_direction_flag is used with **slice_group_map_type** to specify the refined map type when **slice_group_map_type** is 3, 4, or 5.

slice_group_change_rate_minus1 is used to specify the variable **SliceGroupChangeRate**. **SliceGroupChangeRate** specifies the multiple in number of slice group map units by which the size of a slice group can change from one picture to the next. The value of **slice_group_change_rate_minus1** shall be in the range of 0 to **PicSizeInMapUnits - 1**, inclusive. The **SliceGroupChangeRate** variable is specified as follows:

$$\text{SliceGroupChangeRate} = \text{slice_group_change_rate_minus1} + 1 \quad (7-20)$$

pic_size_in_map_units_minus1 is used to specify the number of slice group map units in the picture. **pic_size_in_map_units_minus1** shall be equal to $\text{PicSizeInMapUnits} - 1$.

slice_group_id[i] identifies a slice group of the i -th slice group map unit in raster scan order. The size of the **slice_group_id[i]** syntax element is $\text{Ceil}(\text{Log2}(\text{num_slice_groups_minus1} + 1))$ bits. The value of **slice_group_id[i]** shall be in the range of 0 to **num_slice_groups_minus1**, inclusive.

num_ref_idx_l0_active_minus1 specifies the maximum reference index for reference picture list 0 that shall be used to decode each slice of the picture in which list 0 prediction is used when **num_ref_idx_active_override_flag** is equal to 0 for the slice. When **MbaffFrameFlag** is equal to 1, **num_ref_idx_l0_active_minus1** is the maximum index value for the decoding of frame macroblocks and $2 * \text{num_ref_idx_l0_active_minus1} + 1$ is the maximum index value for the decoding of field macroblocks. The value of **num_ref_idx_l0_active_minus1** shall be in the range of 0 to 31, inclusive.

num_ref_idx_l1_active_minus1 has the same semantics as **num_ref_idx_l0_active_minus1** with l0 and list 0 replaced by l1 and list 1, respectively.

weighted_pred_flag equal to 0 specifies that weighted prediction shall not be applied to P and SP slices. **weighted_pred_flag** equal to 1 specifies that weighted prediction shall be applied to P and SP slices.

weighted_bipred_idc equal to 0 specifies that the default weighted prediction shall be applied to B slices. **weighted_bipred_idc** equal to 1 specifies that explicit weighted prediction shall be applied to B slices. **weighted_bipred_idc** equal to 2 specifies that implicit weighted prediction shall be applied to B slices. The value of **weighted_bipred_idc** shall be in the range of 0 to 2, inclusive.

pic_init_qp_minus26 specifies the initial value minus 26 of SliceQP_Y for each slice. The initial value is modified at the slice layer when a non-zero value of **slice_qp_delta** is decoded, and is modified further when a non-zero value of **mb_qp_delta** is decoded at the macroblock layer. The value of **pic_init_qp_minus26** shall be in the range of $-(26 + \text{QpBdOffset}_Y)$ to +25, inclusive.

pic_init_qs_minus26 specifies the initial value minus 26 of SliceQS_Y for all macroblocks in SP or SI slices. The initial value is modified at the slice layer when a non-zero value of **slice_qs_delta** is decoded. The value of **pic_init_qs_minus26** shall be in the range of -26 to +25, inclusive.

chroma_qp_index_offset specifies the offset that shall be added to QP_Y and QS_Y for addressing the table of QP_C values for the Cb chroma component. The value of **chroma_qp_index_offset** shall be in the range of -12 to +12, inclusive.

deblocking_filter_control_present_flag equal to 1 specifies that a set of syntax elements controlling the characteristics of the deblocking filter is present in the slice header. **deblocking_filter_control_present_flag** equal to 0 specifies that the set of syntax elements controlling the characteristics of the deblocking filter is not present in the slice headers and their inferred values are in effect.

constrained_intra_pred_flag equal to 0 specifies that intra prediction allows usage of residual data and decoded samples of neighbouring macroblocks coded using Inter macroblock prediction modes for the prediction of macroblocks coded using Intra macroblock prediction modes. **constrained_intra_pred_flag** equal to 1 specifies constrained intra prediction, in which case prediction of macroblocks coded using Intra macroblock prediction modes only uses residual data and decoded samples from I or SI macroblock types.

redundant_pic_cnt_present_flag equal to 0 specifies that the **redundant_pic_cnt** syntax element is not present in slice headers, data partitions B, and data partitions C that refer (either directly or by association with a corresponding data partition A) to the picture parameter set. **redundant_pic_cnt_present_flag** equal to 1 specifies that the **redundant_pic_cnt** syntax element is present in all slice headers, data partitions B, and data partitions C that refer (either directly or by association with a corresponding data partition A) to the picture parameter set.

transform_8x8_mode_flag equal to 1 specifies that the 8x8 transform decoding process may be in use (see subclause 8.5). **transform_8x8_mode_flag** equal to 0 specifies that the 8x8 transform decoding process is not in use. When **transform_8x8_mode_flag** is not present, it shall be inferred to be 0.

pic_scaling_matrix_present_flag equal to 1 specifies that parameters are present to modify the scaling lists specified in the sequence parameter set. **pic_scaling_matrix_present_flag** equal to 0 specifies that the scaling lists used for the picture shall be inferred to be equal to those specified by the sequence parameter set. When **pic_scaling_matrix_present_flag** is not present, it shall be inferred to be equal to 0.

pic_scaling_list_present_flag[i] equal to 1 specifies that the scaling list syntax structure is present to specify the scaling list for index i . **pic_scaling_list_present_flag[i]** equal to 0 specifies that the syntax structure for scaling list i is not present in the picture parameter set and that depending on the value of **seq_scaling_matrix_present_flag**, the following applies.

- If `seq_scaling_matrix_present_flag` is equal to 0, the scaling list fall-back rule set A as specified in Table 7-2 shall be used to derive the picture-level scaling list for index *i*.
- Otherwise (`seq_scaling_matrix_present_flag` is equal to 1), the scaling list fall-back rule set B as specified in Table 7-2 shall be used to derive the picture-level scaling list for index *i*.

second_chroma_qp_index_offset specifies the offset that shall be added to QP_Y and QS_Y for addressing the table of QP_C values for the Cr chroma component. The value of `second_chroma_qp_index_offset` shall be in the range of -12 to +12, inclusive.

When `second_chroma_qp_index_offset` is not present, it shall be inferred to be equal to `chroma_qp_index_offset`.

7.4.2.3 Supplemental enhancement information RBSP semantics

Supplemental Enhancement Information (SEI) contains information that is not necessary to decode the samples of coded pictures from VCL NAL units.

7.4.2.3.1 Supplemental enhancement information message semantics

An SEI NAL unit contains one or more SEI messages. Each SEI message consists of the variables specifying the type `payloadType` and size `payloadSize` of the SEI payload. SEI payloads are specified in Annex D. The derived SEI payload size `payloadSize` is specified in bytes and shall be equal to the number of bytes in the SEI payload.

ff_byte is a byte equal to 0xFF identifying a need for a longer representation of the syntax structure that it is used within.

last_payload_type_byte is the last byte of the payload type of an SEI message.

last_payload_size_byte is the last byte of the size of an SEI message.

7.4.2.4 Access unit delimiter RBSP semantics

The access unit delimiter may be used to indicate the type of slices present in a primary coded picture and to simplify the detection of the boundary between access units. There is no normative decoding process associated with the access unit delimiter.

primary_pic_type indicates that the `slice_type` values for all slices of the primary coded picture are members of the set listed in Table 7-5 for the given value of `primary_pic_type`.

Table 7-5 – Meaning of `primary_pic_type`

<code>primary_pic_type</code>	<code>slice_type</code> values that may be present in the primary coded picture
0	I
1	I, P
2	I, P, B
3	SI
4	SI, SP
5	I, SI
6	I, SI, P, SP
7	I, SI, P, SP, B

7.4.2.5 End of sequence RBSP semantics

The end of sequence RBSP specifies that the next subsequent access unit in the bitstream in decoding order (if any) shall be an IDR access unit. The syntax content of the SODB and RBSP for the end of sequence RBSP are empty. No normative decoding process is specified for an end of sequence RBSP.

7.4.2.6 End of stream RBSP semantics

The end of stream RBSP indicates that no additional NAL units shall be present in the bitstream that are subsequent to the end of stream RBSP in decoding order. The syntax content of the SODB and RBSP for the end of stream RBSP are empty. No normative decoding process is specified for an end of stream RBSP.

7.4.2.7 Filler data RBSP semantics

The filler data RBSP contains bytes whose value shall be equal to 0xFF. No normative decoding process is specified for a filler data RBSP.

ff_byte is a byte equal to 0xFF.

7.4.2.8 Slice layer without partitioning RBSP semantics

The slice layer without partitioning RBSP consists of a slice header and slice data.

7.4.2.9 Slice data partition RBSP semantics

7.4.2.9.1 Slice data partition A RBSP semantics

When slice data partitioning is in use, the coded data for a single slice is divided into three separate partitions. Partition A contains all syntax elements of category 2.

Category 2 syntax elements include all syntax elements in the slice header and slice data syntax structures other than the syntax elements in the residual() syntax structure.

slice_id identifies the slice associated with the data partition. Each slice shall have a unique **slice_id** value within the coded picture that contains the slice. When arbitrary slice order is not allowed as specified in Annex A, the first slice of a coded picture, in decoding order, shall have **slice_id** equal to 0 and the value of **slice_id** shall be incremented by one for each subsequent slice of the coded picture in decoding order.

The range of **slice_id** is specified as follows.

- If **MbaffFrameFlag** is equal to 0, **slice_id** shall be in the range of 0 to **PicSizeInMbs** - 1, inclusive.
- Otherwise (**MbaffFrameFlag** is equal to 1), **slice_id** shall be in the range of 0 to **PicSizeInMbs** / 2 - 1, inclusive.

7.4.2.9.2 Slice data partition B RBSP semantics

When slice data partitioning is in use, the coded data for a single slice is divided into one to three separate partitions. Slice data partition B contains all syntax elements of category 3.

Category 3 syntax elements include all syntax elements in the residual() syntax structure and in syntax structures used within that syntax structure for collective macroblock types I and SI as specified in Table 7-10.

slice_id has the same semantics as specified in subclause 7.4.2.9.1.

redundant_pic_cnt shall be equal to 0 for slices and slice data partitions belonging to the primary coded picture. The **redundant_pic_cnt** shall be greater than 0 for coded slices and coded slice data partitions in redundant coded pictures. When **redundant_pic_cnt** is not present, its value shall be inferred to be equal to 0. The value of **redundant_pic_cnt** shall be in the range of 0 to 127, inclusive.

The presence of a slice data partition B RBSP is specified as follows.

- If the syntax elements of a slice data partition A RBSP indicate the presence of any syntax elements of category 3 in the slice data for a slice, a slice data partition B RBSP shall be present having the same value of **slice_id** and **redundant_pic_cnt** as in the slice data partition A RBSP.
- Otherwise (the syntax elements of a slice data partition A RBSP do not indicate the presence of any syntax elements of category 3 in the slice data for a slice), no slice data partition B RBSP shall be present having the same value of **slice_id** and **redundant_pic_cnt** as in the slice data partition A RBSP.

7.4.2.9.3 Slice data partition C RBSP semantics

When slice data partitioning is in use, the coded data for a single slice is divided into three separate partitions. Slice data partition C contains all syntax elements of category 4.

Category 4 syntax elements include all syntax elements in the residual() syntax structure and in syntax structures used within that syntax structure for collective macroblock types P and B as specified in Table 7-10.

slice_id has the same semantics as specified in subclause 7.4.2.9.1.

redundant_pic_cnt has the same semantics as specified in subclause 7.4.2.9.2.

The presence of a slice data partition C RBSP is specified as follows.

- If the syntax elements of a slice data partition A RBSP indicate the presence of any syntax elements of category 4 in the slice data for a slice, a slice data partition C RBSP shall be present having the same value of slice_id and redundant_pic_cnt as in the slice data partition A RBSP.
- Otherwise (the syntax elements of a slice data partition A RBSP do not indicate the presence of any syntax elements of category 4 in the slice data for a slice), no slice data partition C RBSP shall be present having the same value of slice_id and redundant_pic_cnt as in the slice data partition A RBSP.

7.4.2.10 RBSP slice trailing bits semantics

cabac_zero_word is a byte-aligned sequence of two bytes equal to 0x0000.

Let NumBytesInVclNALunits be the sum of the values of NumBytesInNALunit for all VCL NAL units of a coded picture.

Let BinCountsInNALunits be the number of times that the parsing process function DecodeBin(), specified in subclause 9.3.3.2, is invoked to decode the contents of all VCL NAL units of a coded picture. When entropy_coding_mode_flag is equal to 1, BinCountsInNALunits shall not exceed $(32 \div 3) * \text{NumBytesInVclNALunits} + (\text{RawMbBits} * \text{PicSizeInMbs}) \div 32$.

NOTE – The constraint on the maximum number of bins resulting from decoding the contents of the slice layer NAL units can be met by inserting a number of cabac_zero_word syntax elements to increase the value of NumBytesInVclNALunits. Each cabac_zero_word is represented in a NAL unit by the three-byte sequence 0x000003 (as a result of the constraints on NAL unit contents that result in requiring inclusion of an emulation_prevention_three_byte for each cabac_zero_word).

7.4.2.11 RBSP trailing bits semantics

rbsp_stop_one_bit shall be equal to 1.

rbsp_alignment_zero_bit shall be equal to 0.

7.4.3 Slice header semantics

When present, the value of the slice header syntax elements pic_parameter_set_id, frame_num, field_pic_flag, bottom_field_flag, idr_pic_id, pic_order_cnt_lsb, delta_pic_order_cnt_bottom, delta_pic_order_cnt[0], delta_pic_order_cnt[1], sp_for_switch_flag, and slice_group_change_cycle shall be the same in all slice headers of a coded picture.

first_mb_in_slice specifies the address of the first macroblock in the slice. When arbitrary slice order is not allowed as specified in Annex A, the value of first_mb_in_slice shall not be less than the value of first_mb_in_slice for any other slice of the current picture that precedes the current slice in decoding order.

The first macroblock address of the slice is derived as follows.

- If MbaffFrameFlag is equal to 0, first_mb_in_slice is the macroblock address of the first macroblock in the slice, and first_mb_in_slice shall be in the range of 0 to PicSizeInMbs - 1, inclusive.
- Otherwise (MbaffFrameFlag is equal to 1), first_mb_in_slice * 2 is the macroblock address of the first macroblock in the slice, which is the top macroblock of the first macroblock pair in the slice, and first_mb_in_slice shall be in the range of 0 to PicSizeInMbs / 2 - 1, inclusive.

slice_type specifies the coding type of the slice according to Table 7-6.

Table 7-6 – Name association to slice_type

slice_type	Name of slice_type
0	P (P slice)
1	B (B slice)
2	I (I slice)
3	SP (SP slice)
4	SI (SI slice)
5	P (P slice)
6	B (B slice)
7	I (I slice)
8	SP (SP slice)
9	SI (SI slice)

slice_type values in the range 5..9 specify, in addition to the coding type of the current slice, that all other slices of the current coded picture shall have a value of slice_type equal to the current value of slice_type or equal to the current value of slice_type – 5.

When nal_unit_type is equal to 5 (IDR picture), slice_type shall be equal to 2, 4, 7, or 9.

When num_ref_frames is equal to 0, slice_type shall be equal to 2, 4, 7, or 9.

pic_parameter_set_id specifies the picture parameter set in use. The value of pic_parameter_set_id shall be in the range of 0 to 255, inclusive.

frame_num is used as an identifier for pictures and shall be represented by $\log_2(\text{max_frame_num} - \text{min_frame_num} + 1)$ bits in the bitstream. frame_num is constrained as follows:

The variable PrevRefFrameNum is derived as follows.

- If the current picture is an IDR picture, PrevRefFrameNum is set equal to 0.
- Otherwise (the current picture is not an IDR picture), PrevRefFrameNum is set as follows.
 - If the decoding process for gaps in frame_num specified in subclause 8.2.5.2 was invoked by the decoding process for an access unit that contained a non-reference picture that followed the previous access unit in decoding order that contained a reference picture, PrevRefFrameNum is set equal to the value of frame_num for the last of the "non-existing" reference frames inferred by the decoding process for gaps in frame_num specified in subclause 8.2.5.2.
 - Otherwise, PrevRefFrameNum is set equal to the value of frame_num for the previous access unit in decoding order that contained a reference picture.

The value of frame_num is constrained as follows.

- If the current picture is an IDR picture, frame_num shall be equal to 0.
- Otherwise (the current picture is not an IDR picture), referring to the primary coded picture in the previous access unit in decoding order that contains a reference picture as the preceding reference picture, the value of frame_num for the current picture shall not be equal to PrevRefFrameNum unless all of the following three conditions are true.
 - the current picture and the preceding reference picture belong to consecutive access units in decoding order
 - the current picture and the preceding reference picture are reference fields having opposite parity
 - one or more of the following conditions is true
 - the preceding reference picture is an IDR picture
 - the preceding reference picture includes a memory_management_control_operation syntax element equal to 5

NOTE – When the preceding reference picture includes a memory_management_control_operation syntax element equal to 5, PrevRefFrameNum is equal to 0.

- there is a primary coded picture that precedes the preceding reference picture and the primary coded picture that precedes the preceding reference picture does not have frame_num equal to PrevRefFrameNum
- there is a primary coded picture that precedes the preceding reference picture and the primary coded picture that precedes the preceding reference picture is not a reference picture

When the value of frame_num is not equal to PrevRefFrameNum, the following applies.

- There shall not be any previous field or frame in decoding order that is currently marked as "used for short-term reference" that has a value of frame_num equal to any value taken on by the variable UnusedShortTermFrameNum in the following:

$$\begin{aligned} \text{UnusedShortTermFrameNum} &= (\text{PrevRefFrameNum} + 1) \% \text{MaxFrameNum} \\ \text{while}(\text{UnusedShortTermFrameNum} \neq \text{frame_num}) & \\ \text{UnusedShortTermFrameNum} &= (\text{UnusedShortTermFrameNum} + 1) \% \text{MaxFrameNum} \end{aligned} \quad (7-21)$$

- The value of frame_num is constrained as follows.
 - If gaps_in_frame_num_value_allowed_flag is equal to 0, the value of frame_num for the current picture shall be equal to $(\text{PrevRefFrameNum} + 1) \% \text{MaxFrameNum}$.
 - Otherwise (gaps_in_frame_num_value_allowed_flag is equal to 1), the following applies.
 - If frame_num is greater than PrevRefFrameNum, there shall not be any non-reference pictures in the bitstream that follow the previous reference picture and precede the current picture in decoding order in which either of the following conditions is true.
 - The value of frame_num for the non-reference picture is less than PrevRefFrameNum.
 - The value of frame_num for the non-reference picture is greater than the value of frame_num for the current picture.
 - Otherwise (frame_num is less than PrevRefFrameNum), there shall not be any non-reference pictures in the bitstream that follow the previous reference picture and precede the current picture in decoding order in which both of the following conditions are true.
 - The value of frame_num for the non-reference picture is less than PrevRefFrameNum.
 - The value of frame_num for the non-reference picture is greater than the value of frame_num for the current picture.

A picture including a memory_management_control_operation equal to 5 shall have frame_num constraints as described above and, after the decoding of the current picture and the processing of the memory management control operations, the picture shall be inferred to have had frame_num equal to 0 for all subsequent use in the decoding process, except as specified in subclause 7.4.1.2.4.

NOTE – When the primary coded picture is not an IDR picture and does not contain memory_management_control_operation syntax element equal to 5, the value of frame_num of a corresponding redundant coded picture is the same as the value of frame_num in the primary coded picture. Alternatively, the redundant coded picture includes a memory_management_control_operation syntax element equal to 5 and the corresponding primary coded picture is an IDR picture.

field_pic_flag equal to 1 specifies that the slice is a slice of a coded field. field_pic_flag equal to 0 specifies that the slice is a slice of a coded frame. When field_pic_flag is not present it shall be inferred to be equal to 0.

The variable MbaffFrameFlag is derived as follows.

$$\text{MbaffFrameFlag} = (\text{mb_adaptive_frame_field_flag} \ \&\& \ !\text{field_pic_flag}) \quad (7-22)$$

The variable for the picture height in units of macroblocks is derived as follows

$$\text{PicHeightInMbs} = \text{FrameHeightInMbs} / (1 + \text{field_pic_flag}) \quad (7-23)$$

The variable for picture height for the luma component is derived as follows

$$\text{PicHeightInSamples}_L = \text{PicHeightInMbs} * 16 \quad (7-24)$$

The variable for picture height for the chroma component is derived as follows

$$\text{PicHeightInSamples}_C = \text{PicHeightInMbs} * \text{MbHeightC} \quad (7-25)$$

The variable `PicSizeInMbs` for the current picture is derived according to:

$$\text{PicSizeInMbs} = \text{PicWidthInMbs} * \text{PicHeightInMbs} \quad (7-26)$$

The variable `MaxPicNum` is derived as follows.

- If `field_pic_flag` is equal to 0, `MaxPicNum` is set equal to `MaxFrameNum`.
- Otherwise (`field_pic_flag` is equal to 1), `MaxPicNum` is set equal to $2 * \text{MaxFrameNum}$.

The variable `CurrPicNum` is derived as follows.

- If `field_pic_flag` is equal to 0, `CurrPicNum` is set equal to `frame_num`.
- Otherwise (`field_pic_flag` is equal to 1), `CurrPicNum` is set equal to $2 * \text{frame_num} + 1$.

bottom_field_flag equal to 1 specifies that the slice is part of a coded bottom field. `bottom_field_flag` equal to 0 specifies that the picture is a coded top field. When this syntax element is not present for the current slice, it shall be inferred to be equal to 0.

idr_pic_id identifies an IDR picture. The values of `idr_pic_id` in all the slices of an IDR picture shall remain unchanged. When two consecutive access units in decoding order are both IDR access units, the value of `idr_pic_id` in the slices of the first such IDR access unit shall differ from the `idr_pic_id` in the second such IDR access unit. The value of `idr_pic_id` shall be in the range of 0 to 65535, inclusive.

pic_order_cnt_lsb specifies the picture order count modulo `MaxPicOrderCntLsb` for the top field of a coded frame or for a coded field. The size of the `pic_order_cnt_lsb` syntax element is $\log_2 \text{max_pic_order_cnt_lsb_minus4} + 4$ bits. The value of the `pic_order_cnt_lsb` shall be in the range of 0 to `MaxPicOrderCntLsb - 1`, inclusive.

delta_pic_order_cnt_bottom specifies the picture order count difference between the bottom field and the top field of a coded frame as follows.

- If the current picture includes a `memory_management_control_operation` equal to 5, the value of `delta_pic_order_cnt_bottom` shall be in the range of $(1 - \text{MaxPicOrderCntLsb})$ to $2^{31} - 1$, inclusive.
- Otherwise (the current picture does not include a `memory_management_control_operation` equal to 5), the value of `delta_pic_order_cnt_bottom` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive.

When this syntax element is not present in the bitstream for the current slice, it shall be inferred to be equal to 0.

delta_pic_order_cnt[0] specifies the picture order count difference from the expected picture order count for the top field of a coded frame or for a coded field as specified in subclause 8.2.1. The value of `delta_pic_order_cnt[0]` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive. When this syntax element is not present in the bitstream for the current slice, it shall be inferred to be equal to 0.

delta_pic_order_cnt[1] specifies the picture order count difference from the expected picture order count for the bottom field of a coded frame specified in subclause 8.2.1. The value of `delta_pic_order_cnt[1]` shall be in the range of -2^{31} to $2^{31} - 1$, inclusive. When this syntax element is not present in the bitstream for the current slice, it shall be inferred to be equal to 0.

redundant_pic_cnt shall be equal to 0 for slices and slice data partitions belonging to the primary coded picture. The value of `redundant_pic_cnt` shall be greater than 0 for coded slices or coded slice data partitions of a redundant coded picture. When `redundant_pic_cnt` is not present in the bitstream, its value shall be inferred to be equal to 0. The value of `redundant_pic_cnt` shall be in the range of 0 to 127, inclusive.

NOTE - Any area of the decoded primary picture and the corresponding area that would result from application of the decoding process specified in clause 8 for any redundant picture in the same access unit should be visually similar in appearance.

The value of `pic_parameter_set_id` in a coded slice or coded slice data partition of a redundant coded picture shall be such that the value of `pic_order_present_flag` in the picture parameter set in use in a redundant coded picture is equal to the value of `pic_order_present_flag` in the picture parameter set in use in the corresponding primary coded picture.

When present in the primary coded picture and any redundant coded picture, the following syntax elements shall have the same value: `field_pic_flag`, `bottom_field_flag`, and `idr_pic_id`.

When the value of `nal_ref_idc` in one VCL NAL unit of an access unit is equal to 0, the value of `nal_ref_idc` in all other VCL NAL units of the same access unit shall be equal to 0.

NOTE – The above constraint also has the following implications. If the value of `nal_ref_idc` for the VCL NAL units of the primary coded picture is equal to 0, the value of `nal_ref_idc` for the VCL NAL units of any corresponding redundant coded picture are equal to 0; otherwise (the value of `nal_ref_idc` for the VCL NAL units of the primary coded picture is greater than 0), the value of `nal_ref_idc` for the VCL NAL units of any corresponding redundant coded picture are also greater than 0.

The marking status of reference pictures and the value of `frame_num` after the decoded reference picture marking process as specified in subclause 8.2.5 is invoked for the primary coded picture or any redundant coded picture of the same access unit shall be identical regardless whether the primary coded picture or any redundant coded picture (instead of the primary coded picture) of the access unit would be decoded.

NOTE – The above constraint also has the following implications.

If a primary coded picture is not an IDR picture, the contents of the `dec_ref_pic_marking()` syntax structure must be identical in all slice headers of the primary coded picture and all redundant coded pictures corresponding to the primary coded picture.

Otherwise (a primary coded picture is an IDR picture), the following applies.

If a redundant coded picture corresponding to the primary coded picture is an IDR picture, the contents of the `dec_ref_pic_marking()` syntax structure must be identical in all slice headers of the primary coded picture and the redundant coded picture corresponding to the primary coded picture.

Otherwise (a redundant picture corresponding to the primary coded picture is not an IDR picture), all slice headers of the redundant picture must contain a `dec_ref_pic_marking()` structure including a `memory_management_control_operation` syntax element equal to 5, and the following applies.

If the value of `long_term_reference_flag` in the primary coded picture is equal to 0, the `dec_ref_pic_marking` syntax structure of the redundant coded picture must not include a `memory_management_control_operation` syntax element equal to 6.

Otherwise (the value of `long_term_reference_flag` in the primary coded picture is equal to 1), the `dec_ref_pic_marking` syntax structure of the redundant coded picture must include `memory_management_control_operation` syntax elements equal to 5, 4, and 6 in decoding order, and the value of `max_long_term_frame_idx_plus1` must be equal to 1, and the value of `long_term_frame_idx` must be equal to 0.

The values of `TopFieldOrderCnt` and `BottomFieldOrderCnt` (if applicable) that result after completion of the decoding process for any redundant coded picture or the primary coded picture of the same access unit shall be identical regardless whether the primary coded picture or any redundant coded picture (instead of the primary coded picture) of the access unit would be decoded.

There is no required decoding process for a coded slice or coded slice data partition of a redundant coded picture. When the `redundant_pic_cnt` in the slice header of a coded slice is greater than 0, the decoder may discard the coded slice. However, a coded slice or coded slice data partition of any redundant coded picture shall obey the same constraints as a coded slice or coded slice data partition of a primary picture.

NOTE – When some of the samples in the decoded primary picture cannot be correctly decoded due to errors or losses in transmission of the sequence and a coded redundant slice can be correctly decoded, the decoder should replace the samples of the decoded primary picture with the corresponding samples of the decoded redundant slice. When more than one redundant slice covers the relevant region of the primary picture, the redundant slice having the lowest value of `redundant_pic_cnt` should be used.

Redundant slices and slice data partitions having the same value of `redundant_pic_cnt` belong to the same redundant picture. Decoded slices within the same redundant picture need not cover the entire picture area and shall not overlap.

direct_spatial_mv_pred_flag specifies the method used in the decoding process to derive motion vectors and reference indices for inter prediction as follows.

- If `direct_spatial_mv_pred_flag` is equal to 1, the derivation process for luma motion vectors for `B_Skip`, `B_Direct_16x16`, and `B_Direct_8x8` in subclause 8.4.1.2 shall use spatial direct mode prediction as specified in subclause 8.4.1.2.2.
- Otherwise (`direct_spatial_mv_pred_flag` is equal to 0), the derivation process for luma motion vectors for `B_Skip`, `B_Direct_16x16`, and `B_Direct_8x8` in subclause 8.4.1.2 shall use temporal direct mode prediction as specified in subclause 8.4.1.2.3.

num_ref_idx_active_override_flag equal to 0 specifies that the values of the syntax elements `num_ref_idx_l0_active_minus1` and `num_ref_idx_l1_active_minus1` specified in the referred picture parameter set are in effect. `num_ref_idx_active_override_flag` equal to 1 specifies that the `num_ref_idx_l0_active_minus1` and `num_ref_idx_l1_active_minus1` specified in the referred picture parameter set are overridden for the current slice (and only for the current slice) by the following values in the slice header.

When the current slice is a P, SP, or B slice and `field_pic_flag` is equal to 0 and the value of `num_ref_idx_l0_active_minus1` in the picture parameter set exceeds 15, `num_ref_idx_active_override_flag` shall be equal to 1.

When the current slice is a B slice and `field_pic_flag` is equal to 0 and the value of `num_ref_idx_l1_active_minus1` in the picture parameter set exceeds 15, `num_ref_idx_active_override_flag` shall be equal to 1.

num_ref_idx_l0_active_minus1 specifies the maximum reference index for reference picture list 0 that shall be used to decode the slice.

The range of `num_ref_idx_l0_active_minus1` is specified as follows.

- If `field_pic_flag` is equal to 0, `num_ref_idx_l0_active_minus1` shall be in the range of 0 to 15, inclusive. When `MbaffFrameFlag` is equal to 1, `num_ref_idx_l0_active_minus1` is the maximum index value for the decoding of frame macroblocks and $2 * \text{num_ref_idx_l0_active_minus1} + 1$ is the maximum index value for the decoding of field macroblocks.
- Otherwise (`field_pic_flag` is equal to 1), `num_ref_idx_l0_active_minus1` shall be in the range of 0 to 31, inclusive.

num_ref_idx_l1_active_minus1 has the same semantics as `num_ref_idx_l0_active_minus1` with l0 and list 0 replaced by l1 and list 1, respectively.

cabac_init_idc specifies the index for determining the initialisation table used in the initialisation process for context variables. The value of `cabac_init_idc` shall be in the range of 0 to 2, inclusive.

slice_qp_delta specifies the initial value of QP_Y to be used for all the macroblocks in the slice until modified by the value of `mb_qp_delta` in the macroblock layer. The initial QP_Y quantisation parameter for the slice is computed as:

$$\text{SliceQP}_Y = 26 + \text{pic_init_qp_minus26} + \text{slice_qp_delta} \quad (7-27)$$

The value of `slice_qp_delta` shall be limited such that SliceQP_Y is in the range of $-\text{QpBdOffset}_Y$ to +51, inclusive.

sp_for_switch_flag specifies the decoding process to be used to decode P macroblocks in an SP slice as follows.

- If `sp_for_switch_flag` is equal to 0, the P macroblocks in the SP slice shall be decoded using the SP decoding process for non-switching pictures as specified in subclause 8.6.1.
- Otherwise (`sp_for_switch_flag` is equal to 1), the P macroblocks in the SP slice shall be decoded using the SP and SI decoding process for switching pictures as specified in subclause 8.6.2.

slice_qs_delta specifies the value of QS_Y for all the macroblocks in SP and SI slices. The QS_Y quantisation parameter for the slice is computed as:

$$QS_Y = 26 + \text{pic_init_qs_minus26} + \text{slice_qs_delta} \quad (7-28)$$

The value of `slice_qs_delta` shall be limited such that QS_Y is in the range of 0 to 51, inclusive. This value of QS_Y is used for the decoding of all macroblocks in SI slices with `mb_type` equal to SI and all macroblocks in SP slices with prediction mode equal to inter.

disable_deblocking_filter_idc specifies whether the operation of the deblocking filter shall be disabled across some block edges of the slice and specifies for which edges the filtering is disabled. When `disable_deblocking_filter_idc` is not present in the slice header, the value of `disable_deblocking_filter_idc` shall be inferred to be equal to 0.

The value of `disable_deblocking_filter_idc` shall be in the range of 0 to 2, inclusive.

slice_alpha_c0_offset_div2 specifies the offset used in accessing the α and t_{c0} deblocking filter tables for filtering operations controlled by the macroblocks within the slice. From this value, the offset that shall be applied when addressing these tables shall be computed as:

$$\text{FilterOffsetA} = \text{slice_alpha_c0_offset_div2} \ll 1 \quad (7-29)$$

The value of `slice_alpha_c0_offset_div2` shall be in the range of -6 to +6, inclusive. When `slice_alpha_c0_offset_div2` is not present in the slice header, the value of `slice_alpha_c0_offset_div2` shall be inferred to be equal to 0.

slice_beta_offset_div2 specifies the offset used in accessing the β deblocking filter table for filtering operations controlled by the macroblocks within the slice. From this value, the offset that is applied when addressing the β table of the deblocking filter shall be computed as:

$$\text{FilterOffsetB} = \text{slice_beta_offset_div2} \ll 1 \quad (7-30)$$

The value of `slice_beta_offset_div2` shall be in the range of -6 to +6, inclusive. When `slice_beta_offset_div2` is not present in the slice header the value of `slice_beta_offset_div2` shall be inferred to be equal to 0.

slice_group_change_cycle is used to derive the number of slice group map units in slice group 0 when `slice_group_map_type` is equal to 3, 4, or 5, as specified by

$$\text{MapUnitsInSliceGroup0} = \text{Min}(\text{slice_group_change_cycle} * \text{SliceGroupChangeRate}, \text{PicSizeInMapUnits}) \quad (7-31)$$

The value of `slice_group_change_cycle` is represented in the bitstream by the following number of bits

$$\text{Ceil}(\text{Log2}(\text{PicSizeInMapUnits} \div \text{SliceGroupChangeRate} + 1)) \quad (7-32)$$

The value of `slice_group_change_cycle` shall be in the range of 0 to $\text{Ceil}(\text{PicSizeInMapUnits} \div \text{SliceGroupChangeRate})$, inclusive.

7.4.3.1 Reference picture list reordering semantics

The syntax elements `reordering_of_pic_nums_idc`, `abs_diff_pic_num_minus1`, and `long_term_pic_num` specify the change from the initial reference picture lists to the reference picture lists to be used for decoding the slice.

ref_pic_list_reordering_flag_l0 equal to 1 specifies that the syntax element `reordering_of_pic_nums_idc` is present for specifying reference picture list 0. `ref_pic_list_reordering_flag_l0` equal to 0 specifies that this syntax element is not present.

When `ref_pic_list_reordering_flag_l0` is equal to 1, the number of times that `reordering_of_pic_nums_idc` is not equal to 3 following `ref_pic_list_reordering_flag_l0` shall not exceed `num_ref_idx_l0_active_minus1 + 1`.

When `RefPicList0[num_ref_idx_l0_active_minus1]` in the initial reference picture list produced as specified in subclause 8.2.4.2 is equal to "no reference picture", `ref_pic_list_reordering_flag_l0` shall be equal to 1 and `reordering_of_pic_nums_idc` shall not be equal to 3 until `RefPicList0[num_ref_idx_l0_active_minus1]` in the reordered list produced as specified in subclause 8.2.4.3 is not equal to "no reference picture".

ref_pic_list_reordering_flag_l1 equal to 1 specifies that the syntax element `reordering_of_pic_nums_idc` is present for specifying reference picture list 1. `ref_pic_list_reordering_flag_l1` equal to 0 specifies that this syntax element is not present.

When `ref_pic_list_reordering_flag_l1` is equal to 1, the number of times that `reordering_of_pic_nums_idc` is not equal to 3 following `ref_pic_list_reordering_flag_l1` shall not exceed `num_ref_idx_l1_active_minus1 + 1`.

When decoding a B slice and `RefPicList1[num_ref_idx_l1_active_minus1]` in the initial reference picture list produced as specified in subclause 8.2.4.2 is equal to "no reference picture", `ref_pic_list_reordering_flag_l1` shall be equal to 1 and `reordering_of_pic_nums_idc` shall not be equal to 3 until `RefPicList1[num_ref_idx_l1_active_minus1]` in the reordered list produced as specified in subclause 8.2.4.3 is not equal to "no reference picture".

reordering_of_pic_nums_idc together with `abs_diff_pic_num_minus1` or `long_term_pic_num` specifies which of the reference pictures are re-mapped. The values of `reordering_of_pic_nums_idc` are specified in Table 7-7. The value of the first `reordering_of_pic_nums_idc` that follows immediately after `ref_pic_list_reordering_flag_l0` or `ref_pic_list_reordering_flag_l1` shall not be equal to 3.

Table 7-7 – Reordering_of_pic_nums_idc operations for reordering of reference picture lists

reordering_of_pic_nums_idc	Reordering specified
0	<code>abs_diff_pic_num_minus1</code> is present and corresponds to a difference to subtract from a picture number prediction value
1	<code>abs_diff_pic_num_minus1</code> is present and corresponds to a difference to add to a picture number prediction value
2	<code>long_term_pic_num</code> is present and specifies the long-term picture number for a reference picture
3	End loop for reordering of the initial reference picture list

abs_diff_pic_num_minus1 plus 1 specifies the absolute difference between the picture number of the picture being moved to the current index in the list and the picture number prediction value. **abs_diff_pic_num_minus1** shall be in the range of 0 to **MaxPicNum** – 1. The allowed values of **abs_diff_pic_num_minus1** are further restricted as specified in subclause 8.2.4.3.1.

long_term_pic_num specifies the long-term picture number of the picture being moved to the current index in the list. When decoding a coded frame, **long_term_pic_num** shall be equal to a **LongTermPicNum** assigned to one of the reference frames or complementary reference field pairs marked as "used for long-term reference". When decoding a coded field, **long_term_pic_num** shall be equal to a **LongTermPicNum** assigned to one of the reference fields marked as "used for long-term reference".

7.4.3.2 Prediction weight table semantics

luma_log2_weight_denom is the base 2 logarithm of the denominator for all luma weighting factors. The value of **luma_log2_weight_denom** shall be in the range of 0 to 7, inclusive.

chroma_log2_weight_denom is the base 2 logarithm of the denominator for all chroma weighting factors. The value of **chroma_log2_weight_denom** shall be in the range of 0 to 7, inclusive.

luma_weight_l0_flag equal to 1 specifies that weighting factors for the luma component of list 0 prediction are present. **luma_weight_l0_flag** equal to 0 specifies that these weighting factors are not present.

luma_weight_l0[i] is the weighting factor applied to the luma prediction value for list 0 prediction using **RefPicList0[i]**. When **luma_weight_l0_flag** is equal to 1, the value of **luma_weight_l0[i]** shall be in the range of –128 to 127, inclusive. When **luma_weight_l0_flag** is equal to 0, **luma_weight_l0[i]** shall be inferred to be equal to $2^{\text{luma_log2_weight_denom}}$ for **RefPicList0[i]**.

luma_offset_l0[i] is the additive offset applied to the luma prediction value for list 0 prediction using **RefPicList0[i]**. The value of **luma_offset_l0[i]** shall be in the range of –128 to 127, inclusive. When **luma_weight_l0_flag** is equal to 0, **luma_offset_l0[i]** shall be inferred as equal to 0 for **RefPicList0[i]**.

chroma_weight_l0_flag equal to 1 specifies that weighting factors for the chroma prediction values of list 0 prediction are present. **chroma_weight_l0_flag** equal to 0 specifies that these weighting factors are not present.

chroma_weight_l0[i][j] is the weighting factor applied to the chroma prediction values for list 0 prediction using **RefPicList0[i]** with **j** equal to 0 for Cb and **j** equal to 1 for Cr. When **chroma_weight_l0_flag** is equal to 1, the value of **chroma_weight_l0[i][j]** shall be in the range of –128 to 127, inclusive. When **chroma_weight_l0_flag** is equal to 0, **chroma_weight_l0[i][j]** shall be inferred to be equal to $2^{\text{chroma_log2_weight_denom}}$ for **RefPicList0[i]**.

chroma_offset_l0[i][j] is the additive offset applied to the chroma prediction values for list 0 prediction using **RefPicList0[i]** with **j** equal to 0 for Cb and **j** equal to 1 for Cr. The value of **chroma_offset_l0[i][j]** shall be in the range of –128 to 127, inclusive. When **chroma_weight_l0_flag** is equal to 0, **chroma_offset_l0[i][j]** shall be inferred to be equal to 0 for **RefPicList0[i]**.

luma_weight_l1_flag, **luma_weight_l1**, **luma_offset_l1**, **chroma_weight_l1_flag**, **chroma_weight_l1**, **chroma_offset_l1** have the same semantics as **luma_weight_l0_flag**, **luma_weight_l0**, **luma_offset_l0**, **chroma_weight_l0_flag**, **chroma_weight_l0**, **chroma_offset_l0**, respectively, with **l0**, **list 0**, and **List0** replaced by **l1**, **list 1**, and **List1**, respectively.

7.4.3.3 Decoded reference picture marking semantics

The syntax elements **no_output_of_prior_pics_flag**, **long_term_reference_flag**, **adaptive_ref_pic_marking_mode_flag**, **memory_management_control_operation**, **difference_of_pic_nums_minus1**, **long_term_frame_idx**, **long_term_pic_num**, and **max_long_term_frame_idx_plus1** specify marking of the reference pictures.

The marking of a reference picture can be "unused for reference", "used for short-term reference", or "used for long-term reference", but only one among these three. When a reference picture is referred to as being marked as "used for reference", this collectively refers to the picture being marked as "used for short-term reference" or "used for long-term reference" (but not both). A reference picture that is marked as "used for short-term reference" is referred to as a short-term reference picture. A reference picture that is marked as "used for long-term reference" is referred to as a long-term reference picture.

The syntax element **adaptive_ref_pic_marking_mode_flag** and the content of the decoded reference picture marking syntax structure shall be identical for all coded slices of a coded picture.

The syntax category of the decoded reference picture marking syntax structure shall be inferred as follows.

- If the decoded reference picture marking syntax structure is in a slice header, the syntax category of the decoded reference picture marking syntax structure shall be inferred to be equal to 2.
- Otherwise (the decoded reference picture marking syntax structure is in a decoded reference picture marking repetition SEI message as specified in Annex D), the syntax category of the decoded reference picture marking syntax structure shall be inferred to be equal to 5.

no_output_of_prior_pics_flag specifies how the previously-decoded pictures in the decoded picture buffer are treated after decoding of an IDR picture. See Annex C. When the IDR picture is the first IDR picture in the bitstream, the value of **no_output_of_prior_pics_flag** has no effect on the decoding process. When the IDR picture is not the first IDR picture in the bitstream and the value of **PicWidthInMbs**, **FrameHeightInMbs**, or **max_dec_frame_buffering** derived from the active sequence parameter set is different from the value of **PicWidthInMbs**, **FrameHeightInMbs**, or **max_dec_frame_buffering** derived from the sequence parameter set active for the preceding sequence, **no_output_of_prior_pics_flag** equal to 1 may be inferred by the decoder, regardless of the actual value of **no_output_of_prior_pics_flag**.

long_term_reference_flag equal to 0 specifies that the **MaxLongTermFrameIdx** variable is set equal to “no long-term frame indices” and that the IDR picture is marked as “used for short-term reference”. **long_term_reference_flag** equal to 1 specifies that the **MaxLongTermFrameIdx** variable is set equal to 0 and that the current IDR picture is marked “used for long-term reference” and is assigned **LongTermFrameIdx** equal to 0. When **num_ref_frames** is equal to 0, **long_term_reference_flag** shall be equal to 0.

adaptive_ref_pic_marking_mode_flag selects the reference picture marking mode of the currently decoded picture as specified in Table 7-8. **adaptive_ref_pic_marking_mode_flag** shall be equal to 1 when the number of frames, complementary field pairs, and non-paired fields that are currently marked as “used for long-term reference” is equal to $\text{Max}(\text{num_ref_frames}, 1)$.

Table 7-8 – Interpretation of **adaptive_ref_pic_marking_mode_flag**

adaptive_ref_pic_marking_mode_flag	Reference picture marking mode specified
0	Sliding window reference picture marking mode: A marking mode providing a first-in first-out mechanism for short-term reference pictures.
1	Adaptive reference picture marking mode: A reference picture marking mode providing syntax elements to specify marking of reference pictures as “unused for reference” and to assign long-term frame indices.

memory_management_control_operation specifies a control operation to be applied to affect the reference picture marking. The **memory_management_control_operation** syntax element is followed by data necessary for the operation specified by the value of **memory_management_control_operation**. The values and control operations associated with **memory_management_control_operation** are specified in Table 7-9. The **memory_management_control_operation** syntax elements are processed by the decoding process in the order in which they appear in the slice header, and the semantics constraints expressed for each **memory_management_control_operation** apply at the specific position in that order at which that individual **memory_management_control_operation** is processed.

For interpretation of **memory_management_control_operation**, the term reference picture is interpreted as follows.

- If the current picture is a frame, the term reference picture refers either to a reference frame or a complementary reference field pair.
- Otherwise (the current picture is a field), the term reference picture refers either to a reference field or a field of a reference frame.

memory_management_control_operation shall not be equal to 1 in a slice header unless the specified reference picture is marked as “used for short-term reference” when the **memory_management_control_operation** is processed by the decoding process.

memory_management_control_operation shall not be equal to 2 in a slice header unless the specified long-term picture number refers to a reference picture that is marked as “used for long-term reference” when the **memory_management_control_operation** is processed by the decoding process.

memory_management_control_operation shall not be equal to 3 in a slice header unless the specified reference picture is marked as "used for short-term reference" when the memory_management_control_operation is processed by the decoding process.

memory_management_control_operation shall not be equal to 3 or 6 if the value of the variable MaxLongTermFrameIdx is equal to "no long-term frame indices" when the memory_management_control_operation is processed by the decoding process.

Not more than one memory_management_control_operation equal to 4 shall be present in a slice header.

Not more than one memory_management_control_operation equal to 5 shall be present in a slice header.

Not more than one memory_management_control_operation equal to 6 shall be present in a slice header.

memory_management_control_operation shall not be equal to 5 in a slice header unless no memory_management_control_operation in the range of 1 to 3 is present in the same decoded reference picture marking syntax structure.

A memory_management_control_operation equal to 5 shall not follow a memory_management_control_operation equal to 6 in the same slice header.

When a memory_management_control_operation equal to 6 is present, any memory_management_control_operation equal to 2, 3, or 4 that follows the memory_management_control_operation equal to 6 within the same slice header shall not specify the current picture to be marked as "unused for reference".

NOTE – These constraints prohibit any combination of multiple memory_management_control_operation syntax elements that would specify the current picture to be marked as "unused for reference". However, some other combinations of memory_management_control_operation syntax elements are permitted that may affect the marking status of other reference pictures more than once in the same slice header. In particular, it is permitted for a memory_management_control_operation equal to 3 that specifies a long-term frame index to be assigned to a particular short-term reference picture to be followed in the same slice header by a memory_management_control_operation equal to 2, 3, 4 or 6 that specifies the same reference picture to subsequently be marked as "unused for reference".

Table 7-9 – Memory management control operation (memory_management_control_operation) values

memory_management_control_operation	Memory Management Control Operation
0	End memory_management_control_operation syntax element loop
1	Mark a short-term reference picture as "unused for reference"
2	Mark a long-term reference picture as "unused for reference"
3	Mark a short-term reference picture as "used for long-term reference" and assign a long-term frame index to it
4	Specify the maximum long-term frame index and mark all long-term reference pictures having long-term frame indices greater than the maximum value as "unused for reference"
5	Mark all reference pictures as "unused for reference" and set the MaxLongTermFrameIdx variable to "no long-term frame indices"
6	Mark the current picture as "used for long-term reference" and assign a long-term frame index to it

When decoding a field and a memory_management_control_operation command equal to 3 is present that assigns a long-term frame index to a field that is part of a short-term reference frame or part of a short-term complementary reference field pair, another memory_management_control_operation command to assign the same long-term frame index to the other field of the same frame or complementary reference field pair shall be present in the same decoded reference picture marking syntax structure.

NOTE – The above requirement must be fulfilled even when the field referred to by the `memory_management_control_operation` equal to 3 is subsequently marked as "unused for reference" (for example when a `memory_management_control_operation` equal to 2 is present in the same slice header that causes the field to be marked as "unused for reference").

When the first field (in decoding order) of a complementary reference field pair includes a `long_term_reference_flag` equal to 1 or a `memory_management_control_operation` command equal to 6, the decoded reference picture marking syntax structure for the other field of the complementary reference field pair shall contain a `memory_management_control_operation` command equal to 6 that assigns the same long-term frame index to the other field.

NOTE – The above requirement must be fulfilled even when the first field of the complementary reference field pair is subsequently marked as "unused for reference" (for example, when a `memory_management_control_operation` equal to 2 is present in the slice header of the second field that causes the first field to be marked as "unused for reference").

difference_of_pic_nums_minus1 is used (with `memory_management_control_operation` equal to 3 or 1) to assign a long-term frame index to a short-term reference picture or to mark a short-term reference picture as "unused for reference". When the associated `memory_management_control_operation` is processed by the decoding process, the resulting picture number derived from `difference_of_pic_nums_minus1` shall be a picture number assigned to one of the reference pictures marked as "used for reference" and not previously assigned to a long-term frame index.

The resulting picture number is constrained as follows.

- If `field_pic_flag` is equal to 0, the resulting picture number shall be one of the set of picture numbers assigned to reference frames or complementary reference field pairs.

NOTE – When `field_pic_flag` is equal to 0, the resulting picture number must be a picture number assigned to a complementary reference field pair in which both fields are marked as "used for reference" or a frame in which both fields are marked as "used for reference". In particular, when `field_pic_flag` is equal to 0, the marking of a non-paired field or a frame in which a single field is marked as "used for reference" cannot be affected by a `memory_management_control_operation` equal to 1.

- Otherwise (`field_pic_flag` is equal to 1), the resulting picture number shall be one of the set of picture numbers assigned to reference fields.

long_term_pic_num is used (with `memory_management_control_operation` equal to 2) to mark a long-term reference picture as "unused for reference". When the associated `memory_management_control_operation` is processed by the decoding process, `long_term_pic_num` shall be equal to a long-term picture number assigned to one of the reference pictures that is currently marked as "used for long-term reference".

The resulting long-term picture number is constrained as follows.

- If `field_pic_flag` is equal to 0, the resulting long-term picture number shall be one of the set of long-term picture numbers assigned to reference frames or complementary reference field pairs.

NOTE – When `field_pic_flag` is equal to 0, the resulting long-term picture number must be a long-term picture number assigned to a complementary reference field pair in which both fields are marked as "used for reference" or a frame in which both fields are marked as "used for reference". In particular, when `field_pic_flag` is equal to 0, the marking of a non-paired field or a frame in which a single field is marked as "used for reference" cannot be affected by a `memory_management_control_operation` equal to 2.

- Otherwise (`field_pic_flag` is equal to 1), the resulting long-term picture number shall be one of the set of long-term picture numbers assigned to reference fields.

long_term_frame_idx is used (with `memory_management_control_operation` equal to 3 or 6) to assign a long-term frame index to a picture. When the associated `memory_management_control_operation` is processed by the decoding process, the value of `long_term_frame_idx` shall be in the range of 0 to `MaxLongTermFrameIdx`, inclusive.

max_long_term_frame_idx_plus1 minus 1 specifies the maximum value of long-term frame index allowed for long-term reference pictures (until receipt of another value of `max_long_term_frame_idx_plus1`). The value of `max_long_term_frame_idx_plus1` shall be in the range of 0 to `num_ref_frames`, inclusive.

7.4.4 Slice data semantics

cabac_alignment_one_bit is a bit equal to 1.

mb_skip_run specifies the number of consecutive skipped macroblocks for which, when decoding a P or SP slice, `mb_type` shall be inferred to be `P_Skip` and the macroblock type is collectively referred to as a P macroblock type, or for which, when decoding a B slice, `mb_type` shall be inferred to be `B_Skip` and the macroblock type is collectively referred to as a B macroblock type. The value of `mb_skip_run` shall be in the range of 0 to `PicSizeInMbs – CurrMbAddr`, inclusive.

mb_skip_flag equal to 1 specifies that for the current macroblock, when decoding a P or SP slice, **mb_type** shall be inferred to be P_Skip and the macroblock type is collectively referred to as P macroblock type, or for which, when decoding a B slice, **mb_type** shall be inferred to be B_Skip and the macroblock type is collectively referred to as B macroblock type. **mb_skip_flag** equal to 0 specifies that the current macroblock is not skipped.

mb_field_decoding_flag equal to 0 specifies that the current macroblock pair is a frame macroblock pair. **mb_field_decoding_flag** equal to 1 specifies that the macroblock pair is a field macroblock pair. Both macroblocks of a frame macroblock pair are referred to in the text as frame macroblocks, whereas both macroblocks of a field macroblock pair are referred to in the text as field macroblocks.

When **mb_field_decoding_flag** is not present for either macroblock of a macroblock pair, the value of **mb_field_decoding_flag** is derived as follows.

- If there is a neighbouring macroblock pair immediately to the left of the current macroblock pair in the same slice, the value of **mb_field_decoding_flag** shall be inferred to be equal to the value of **mb_field_decoding_flag** for the neighbouring macroblock pair immediately to the left of the current macroblock pair,
- Otherwise, if there is no neighbouring macroblock pair immediately to the left of the current macroblock pair in the same slice and there is a neighbouring macroblock pair immediately above the current macroblock pair in the same slice, the value of **mb_field_decoding_flag** shall be inferred to be equal to the value of **mb_field_decoding_flag** for the neighbouring macroblock pair immediately above the current macroblock pair,
- Otherwise (there is no neighbouring macroblock pair either immediately to the left or immediately above the current macroblock pair in the same slice), the value of **mb_field_decoding_flag** shall be inferred to be equal to 0.

end_of_slice_flag equal to 0 specifies that another macroblock is following in the slice. **end_of_slice_flag** equal to 1 specifies the end of the slice and that no further macroblock follows.

The function `NextMbAddress( )` used in the slice data syntax table is specified in subclause 8.2.2.

7.4.5 Macroblock layer semantics

mb_type specifies the macroblock type. The semantics of **mb_type** depend on the slice type.

Tables and semantics are specified for the various macroblock types for I, SI, P, SP, and B slices. Each table presents the value of **mb_type**, the name of **mb_type**, the number of macroblock partitions used (given by the `NumMbPart( mb_type )` function), the prediction mode of the macroblock (when it is not partitioned) or the first partition (given by the `MbPartPredMode( mb_type, 0 )` function) and the prediction mode of the second partition (given by the `MbPartPredMode( mb_type, 1 )` function). When a value is not applicable it is designated by “na”. In the text, the value of **mb_type** may be referred to as the macroblock type and a value X of `MbPartPredMode( )` may be referred to in the text by “X macroblock (partition) prediction mode” or as “X prediction macroblocks”.

Table 7-10 shows the allowed collective macroblock types for each slice_type.

NOTE – There are some macroblock types with Pred_L0 prediction mode that are classified as B macroblock types.

Table 7-10 – Allowed collective macroblock types for slice_type

slice_type	allowed collective macroblock types
I (slice)	I (see Table 7-11) (macroblock types)
P (slice)	P (see Table 7-13) and I (see Table 7-11) (macroblock types)
B (slice)	B (see Table 7-14) and I (see Table 7-11) (macroblock types)
SI (slice)	SI (see Table 7-12) and I (see Table 7-11) (macroblock types)
SP (slice)	P (see Table 7-13) and I (see Table 7-11) (macroblock types)

transform_size_8x8_flag equal to 1 specifies that for the current macroblock the transform coefficient decoding process and picture construction process prior to deblocking filter process for residual 8x8 blocks shall be invoked for luma samples. **transform_size_8x8_flag** equal to 0 specifies that for the current macroblock the transform coefficient decoding process and picture construction process prior to deblocking filter process for residual 4x4 blocks shall be invoked for luma samples. When **transform_size_8x8_flag** is not present in the bitstream, it shall be inferred to be equal to 0.

NOTE – When the current macroblock prediction mode $\text{MbPartPredMode}(\text{mb_type}, 0)$ is equal to Intra_16x16 , $\text{transform_size_8x8_flag}$ is not present in the bitstream and then inferred to be equal to 0.

When $\text{sub_mb_type}[\text{mbPartIdx}]$ (see subclause 7.4.5.2) is present in the bitstream for all 8x8 blocks indexed by $\text{mbPartIdx} = 0..3$, the variable $\text{noSubMbPartSizeLessThan8x8Flag}$ indicates whether for each of the four 8x8 blocks the corresponding $\text{SubMbPartWidth}(\text{sub_mb_type}[\text{mbPartIdx}])$ and $\text{SubMbPartHeight}(\text{sub_mb_type}[\text{mbPartIdx}])$ are both equal to 8.

NOTE –When $\text{noSubMbPartSizeLessThan8x8Flag}$ is equal to 0 and the current macroblock type is not equal to I_NxN , $\text{transform_size_8x8_flag}$ is not present in the bitstream and then inferred to be equal to 0.

Macroblock types that may be collectively referred to as I macroblock types are specified in Table 7-11.

The macroblock types for I slices are all I macroblock types.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 14496-10:2005

Table 7-11 – Macroblock types for I slices

mb_type	Name of mb_type	transform_size_8x8_flag	MbPartPredMode (mb_type, 0)	Intra16x16PredMode	CodedBlockPatternChroma	CodedBlockPatternLuma

25	I_PCM	na	na	na	na	na

The following semantics are assigned to the macroblock types in Table 7-11.

I_NxN: A mnemonic name for mb_type equal to 0 with MbPartPredMode(mb_type, 0) equal to Intra_4x4 or Intra_8x8.

I_16x16_0_0_0, I_16x16_1_0_0, I_16x16_2_0_0, I_16x16_3_0_0, I_16x16_0_1_0, I_16x16_1_1_0, I_16x16_2_1_0, I_16x16_3_1_0, I_16x16_0_2_0, I_16x16_1_2_0, I_16x16_2_2_0, I_16x16_3_2_0, I_16x16_0_0_1, I_16x16_1_0_1, I_16x16_2_0_1, I_16x16_3_0_1, I_16x16_0_1_1, I_16x16_1_1_1, I_16x16_2_1_1, I_16x16_3_1_1, I_16x16_0_2_1, I_16x16_1_2_1, I_16x16_2_2_1, I_16x16_3_2_1: the macroblock is coded as an Intra_16x16 prediction mode macroblock.

To each Intra_16x16 prediction macroblock, an Intra16x16PredMode is assigned, which specifies the Intra_16x16 prediction mode. CodedBlockPatternChroma contains the coded block pattern value for chroma as specified in Table 7-15. When chroma_format_idc is equal to 0, CodedBlockPatternChroma shall be equal to 0. CodedBlockPatternLuma specifies whether, for the luma component, non-zero AC transform coefficient levels are present. CodedBlockPatternLuma equal to 0 specifies that all AC transform coefficient levels in the luma component of the macroblock are equal to 0. CodedBlockPatternLuma equal to 15 specifies that at least one of the AC transform coefficient levels in the luma component of the macroblock is non-zero, requiring scanning of AC transform coefficient levels for all 16 of the 4x4 blocks in the 16x16 block.

Intra_4x4 specifies the macroblock prediction mode and specifies that the Intra_4x4 prediction process is invoked as specified in subclause 8.3.1. Intra_4x4 is an Intra macroblock prediction mode.

Intra_8x8 specifies the macroblock prediction mode and specifies that the Intra_8x8 prediction process is invoked as specified in subclause 8.3.2. Intra_8x8 is an Intra macroblock prediction mode.

Intra_16x16 specifies the macroblock prediction mode and specifies that the Intra_16x16 prediction process is invoked as specified in subclause 8.3.3. Intra_16x16 is an Intra macroblock prediction mode.

For a macroblock coded with mb_type equal to I_PCM, the Intra macroblock prediction mode shall be inferred.

A macroblock type that may be referred to as SI macroblock type is specified in Table 7-12.

The macroblock types for SI slices are specified in Table 7-12 and Table 7-11. The mb_type value 0 is specified in Table 7-12 and the mb_type values 1 to 26 are specified in Table 7-11, indexed by subtracting 1 from the value of mb_type.

Table 7-12 – Macroblock type with value 0 for SI slices

mb_type	Name of mb_type	MbPartPredMode (mb_type, 0)	Intra16x16PredMode	CodedBlockPatternChroma	CodedBlockPatternLuma
0	SI	Intra_4x4	na	Equation 7-33	Equation 7-33

The following semantics are assigned to the macroblock type in Table 7-12. The SI macroblock is coded as Intra_4x4 prediction macroblock.

Macroblock types that may be collectively referred to as P macroblock types are specified in Table 7-13.

The macroblock types for P and SP slices are specified in Table 7-13 and Table 7-11. mb_type values 0 to 4 are specified in Table 7-13 and mb_type values 5 to 30 are specified in Table 7-11, indexed by subtracting 5 from the value of mb_type.

Table 7-13 – Macroblock type values 0 to 4 for P and SP slices

mb_type	Name of mb_type	NumMbPart (mb_type)	MbPartPredMode (mb_type, 0)	MbPartPredMode (mb_type, 1)	MbPartWidth (mb_type)	MbPartHeight (mb_type)
0	P_L0_16x16	1	Pred_L0	na	16	16
1	P_L0_L0_16x8	2	Pred_L0	Pred_L0	16	8
2	P_L0_L0_8x16	2	Pred_L0	Pred_L0	8	16
3	P_8x8	4	na	na	8	8
4	P_8x8ref0	4	na	na	8	8
inferred	P_Skip	1	Pred_L0	na	16	16

The following semantics are assigned to the macroblock types in Table 7-13.

- P_L0_16x16: the samples of the macroblock are predicted with one luma macroblock partition of size 16x16 luma samples and associated chroma samples.
- P_L0_L0_MxN, with MxN being replaced by 16x8 or 8x16: the samples of the macroblock are predicted using two luma partitions of size MxN equal to 16x8, or two luma partitions of size MxN equal to 8x16, and associated chroma samples, respectively.
- P_8x8: for each sub-macroblock an additional syntax element (sub_mb_type) is present in the bitstream that specifies the type of the corresponding sub-macroblock (see subclause 7.4.5.2).
- P_8x8ref0: has the same semantics as P_8x8 but no syntax element for the reference index (ref_idx_l0) is present in the bitstream and ref_idx_l0[mbPartIdx] shall be inferred to be equal to 0 for all sub-macroblocks of the macroblock (with indices mbPartIdx equal to 0..3).
- P_Skip: no further data is present for the macroblock in the bitstream.

The following semantics are assigned to the macroblock prediction modes (MbPartPredMode()) in Table 7-13.

- Pred_L0: specifies that the inter prediction process is invoked using list 0 prediction. Pred_L0 is an Inter macroblock prediction mode.

Macroblock types that may be collectively referred to as B macroblock types are specified in Table 7-14.

The macroblock types for B slices are specified in Table 7-14 and Table 7-11. The mb_type values 0 to 22 are specified in Table 7-14 and the mb_type values 23 to 48 are specified in Table 7-11, indexed by subtracting 23 from the value of

Table 7-14 – Macroblock type values 0 to 22 for B slices

mb_type	Name of mb_type	NumMbPart (mb_type)	MbPartPredMode (mb_type, 0)	MbPartPredMode (mb_type, 1)	MbPartWidth (mb_type)	MbPartHeight (mb_type)
0	B_Direct_16x16	na	Direct	na	8	8
1	B_L0_16x16	1	Pred_L0	na	16	16
2	B_L1_16x16	1	Pred_L1	na	16	16
3	B_Bi_16x16	1	BiPred	na	16	16
4	B_L0_L0_16x8	2	Pred_L0	Pred_L0	16	8
5	B_L0_L0_8x16	2	Pred_L0	Pred_L0	8	16
6	B_L1_L1_16x8	2	Pred_L1	Pred_L1	16	8
7	B_L1_L1_8x16	2	Pred_L1	Pred_L1	8	16
8	B_L0_L1_16x8	2	Pred_L0	Pred_L1	16	8
9	B_L0_L1_8x16	2	Pred_L0	Pred_L1	8	16
10	B_L1_L0_16x8	2	Pred_L1	Pred_L0	16	8
11	B_L1_L0_8x16	2	Pred_L1	Pred_L0	8	16
12	B_L0_Bi_16x8	2	Pred_L0	BiPred	16	8
13	B_L0_Bi_8x16	2	Pred_L0	BiPred	8	16
14	B_L1_Bi_16x8	2	Pred_L1	BiPred	16	8
15	B_L1_Bi_8x16	2	Pred_L1	BiPred	8	16
16	B_Bi_L0_16x8	2	BiPred	Pred_L0	16	8
17	B_Bi_L0_8x16	2	BiPred	Pred_L0	8	16
18	B_Bi_L1_16x8	2	BiPred	Pred_L1	16	8
19	B_Bi_L1_8x16	2	BiPred	Pred_L1	8	16
20	B_Bi_Bi_16x8	2	BiPred	BiPred	16	8
21	B_Bi_Bi_8x16	2	BiPred	BiPred	8	16
22	B_8x8	4	na	na	8	8
inferred	B_Skip	na	Direct	na	8	8

The following semantics are assigned to the macroblock types in Table 7-14:

- B_Direct_16x16: no motion vector differences or reference indices are present for the macroblock in the bitstream. The functions MbPartWidth(B_Direct_16x16), and MbPartHeight(B_Direct_16x16) are used in the derivation process for motion vectors and reference frame indices in subclause 8.4.1 for direct mode prediction.
- B_X_16x16 with X being replaced by L0, L1, or Bi: the samples of the macroblock are predicted with one luma macroblock partition of size 16x16 luma samples and associated chroma samples. For a macroblock with type B_X_16x16 with X being replaced by either L0 or L1, one motion vector difference and one reference index is present in the bitstream for the macroblock. For a macroblock with type B_X_16x16 with X being replaced by Bi, two motion vector differences and two reference indices are present in the bitstream for the macroblock.
- B_X0_X1_MxN, with X0, X1 referring to the first and second macroblock partition and being replaced by L0, L1, or Bi, and MxN being replaced by 16x8 or 8x16: the samples of the macroblock are predicted using two luma partitions of size MxN equal to 16x8, or two luma partitions of size MxN equal to 8x16, and associated chroma samples, respectively. For a macroblock partition X0 or X1 with X0 or X1 being replaced by either L0 or L1, one motion vector difference and one reference index is present in the bitstream. For a macroblock partition X0 or X1 with X0 or X1 being replaced by Bi, two motion vector differences and two reference indices are present in the bitstream for the macroblock partition.
- B_8x8: for each sub-macroblock an additional syntax element (sub_mb_type) is present in the bitstream that specifies the type of the corresponding sub-macroblock (see subclause 7.4.5.2).
- B_Skip: no further data is present for the macroblock in the bitstream. The functions MbPartWidth(B_Skip), and MbPartHeight(B_Skip) are used in the derivation process for motion vectors and reference frame indices in subclause 8.4.1 for direct mode prediction.

The following semantics are assigned to the macroblock prediction modes (MbPartPredMode()) in Table 7-14.

- Direct: no motion vector differences or reference indices are present for the macroblock (in case of B_Skip or B_Direct_16x16) in the bitstream. Direct is an Inter macroblock prediction mode.
- Pred_L0: see semantics for Table 7-13.
- Pred_L1: specifies that the Inter prediction process is invoked using list 1 prediction. Pred_L1 is an Inter macroblock prediction mode.
- BiPred: specifies that the Inter prediction process is invoked using list 0 and list 1 prediction. BiPred is an Inter macroblock prediction mode.

pcm_alignment_zero_bit is a bit equal to 0.

pcm_sample_luma[i] is a sample value. The first pcm_sample_luma[i] values represent luma sample values in the raster scan within the macroblock. The number of bits used to represent each of these samples is BitDepth_Y. When profile_idc is not equal to 100, 110, 122, or 144, pcm_sample_luma[i] shall not be equal to 0.

pcm_sample_chroma[i] is a sample value. The first MbWidthC * MbHeightC pcm_sample_chroma[i] values represent Cb sample values in the raster scan within the macroblock and the remaining MbWidthC * MbHeightC pcm_sample_chroma[i] values represent Cr sample values in the raster scan within the macroblock. The number of bits used to represent each of these samples is BitDepth_C. When profile_idc is not equal to 100, 110, 122, or 144, pcm_sample_chroma[i] shall not be equal to 0.

coded_block_pattern specifies which of the six 8x8 blocks - luma and chroma – may contain non-zero transform coefficient levels. For macroblocks with prediction mode not equal to Intra_16x16, coded_block_pattern is present in the bitstream and the variables CodedBlockPatternLuma and CodedBlockPatternChroma are derived as follows.

$$\begin{aligned} \text{CodedBlockPatternLuma} &= \text{coded_block_pattern} \% 16 \\ \text{CodedBlockPatternChroma} &= \text{coded_block_pattern} / 16 \end{aligned} \quad (7-33)$$

When coded_block_pattern is present, CodedBlockPatternLuma specifies, for each of the four 8x8 luma blocks of the macroblock, one of the following cases.

- All transform coefficient levels of the four 4x4 luma blocks in the 8x8 luma block are equal to zero
- One or more transform coefficient levels of one or more of the 4x4 luma blocks in the 8x8 luma block shall be non-zero valued.

The meaning of CodedBlockPatternChroma is specified in Table 7-15.

Table 7-15 – Specification of CodedBlockPatternChroma values

CodedBlockPatternChroma	Description
0	All chroma transform coefficient levels are equal to 0.
1	One or more chroma DC transform coefficient levels shall be non-zero valued. All chroma AC transform coefficient levels are equal to 0.
2	Zero or more chroma DC transform coefficient levels are non-zero valued. One or more chroma AC transform coefficient levels shall be non-zero valued.

mb_qp_delta can change the value of QP_Y in the macroblock layer. The decoded value of **mb_qp_delta** shall be in the range of $-(26 + QpBdOffset_Y / 2)$ to $+(25 + QpBdOffset_Y / 2)$, inclusive. **mb_qp_delta** shall be inferred to be equal to 0 when it is not present for any macroblock (including P_Skip and B_Skip macroblock types).

The value of QP_Y is derived as

$$QP_Y = ((QP_{Y,PREV} + mb_qp_delta + 52 + 2 * QpBdOffset_Y) \% (52 + QpBdOffset_Y)) - QpBdOffset_Y \quad (7-34)$$

where $QP_{Y,PREV}$ is the luma quantisation parameter, QP_Y , of the previous macroblock in decoding order in the current slice. For the first macroblock in the slice $QP_{Y,PREV}$ is initially set equal to $SliceQP_Y$ derived in Equation 7-27 at the start of each slice.

The value of QP'_Y is derived as

$$QP'_Y = QP_Y + QpBdOffset_Y \quad (7-35)$$

7.4.5.1 Macroblock prediction semantics

All samples of the macroblock are predicted. The prediction modes are derived using the following syntax elements.

prev_intra4x4_pred_mode_flag[luma4x4BlkIdx] and **rem_intra4x4_pred_mode**[luma4x4BlkIdx] specify the Intra_4x4 prediction of the 4x4 luma block with index luma4x4BlkIdx = 0..15.

prev_intra8x8_pred_mode_flag[luma8x8BlkIdx] and **rem_intra8x8_pred_mode**[luma8x8BlkIdx] specify the Intra_8x8 prediction of the 8x8 luma block with index luma8x8BlkIdx = 0..3.

intra_chroma_pred_mode specifies the type of spatial prediction used for chroma in macroblocks using Intra_4x4 or Intra_16x16 prediction, as shown in Table 7-16. The value of **intra_chroma_pred_mode** shall be in the range of 0 to 3, inclusive.

Table 7-16 – Relationship between intra_chroma_pred_mode and spatial prediction modes

intra_chroma_pred_mode	Intra Chroma Prediction Mode
0	DC
1	Horizontal
2	Vertical
3	Plane

ref_idx_10[mbPartIdx] when present, specifies the index in reference picture list 0 of the reference picture to be used for prediction.

The range of **ref_idx_10**[mbPartIdx], the index in list 0 of the reference picture, and, if applicable, the parity of the field within the reference picture used for prediction are specified as follows.

- If MbaffFrameFlag is equal to 0 or mb_field_decoding_flag is equal to 0, the value of ref_idx_l0[mbPartIdx] shall be in the range of 0 to num_ref_idx_l0_active_minus1, inclusive.
- Otherwise (MbaffFrameFlag is equal to 1 and mb_field_decoding_flag is equal to 1), the value of ref_idx_l0[mbPartIdx] shall be in the range of 0 to 2 * num_ref_idx_l0_active_minus1 + 1, inclusive.

When only one reference picture is used for inter prediction, the values of ref_idx_l0[mbPartIdx] shall be inferred to be equal to 0.

ref_idx_l1[mbPartIdx] has the same semantics as ref_idx_l0, with l0 and list 0 replaced by l1 and list 1, respectively.

mvd_l0[mbPartIdx][0][compIdx] specifies the difference between a vector component to be used and its prediction. The index mbPartIdx specifies to which macroblock partition mvd_l0 is assigned. The partitioning of the macroblock is specified by mb_type. The horizontal motion vector component difference is decoded first in decoding order and is assigned CompIdx = 0. The vertical motion vector component is decoded second in decoding order and is assigned CompIdx = 1. The range of the components of mvd_l0[mbPartIdx][0][compIdx] is specified by constraints on the motion vector variable values derived from it as specified in Annex A.

mvd_l1[mbPartIdx][0][compIdx] has the same semantics as mvd_l0, with l0 and L0 replaced by l1 and L1, respectively.

7.4.5.2 Sub-macroblock prediction semantics

sub_mb_type[mbPartIdx] specifies the sub-macroblock types.

Tables and semantics are specified for the various sub-macroblock types for P₁ and B macroblock types. Each table presents the value of sub_mb_type, the name of sub_mb_type, the number of sub-macroblock partitions used (given by the NumSubMbPart(sub_mb_type) function), and the prediction mode of the sub-macroblock (given by the SubMbPredMode(sub_mb_type) function). In the text, the value of sub_mb_type may be referred to by "sub-macroblock type". In the text, the value of SubMbPredMode() may be referred to by "sub-macroblock prediction mode".

The interpretation of sub_mb_type[mbPartIdx] for P macroblock types is specified in Table 7-17, where the row for "inferred" specifies values inferred when sub_mb_type[mbPartIdx] is not present.

Table 7-17 – Sub-macroblock types in P macroblocks

sub_mb_type[mbPartIdx]	Name of sub_mb_type[mbPartIdx]	NumSubMbPart (sub_mb_type[mbPartIdx])	SubMbPredMode (sub_mb_type[mbPartIdx])	SubMbPartWidth (sub_mb_type[mbPartIdx])	SubMbPartHeight (sub_mb_type[mbPartIdx])
inferred	na	na	na	na	na
0	P_L0_8x8	1	Pred_L0	8	8
1	P_L0_8x4	2	Pred_L0	8	4
2	P_L0_4x8	2	Pred_L0	4	8
3	P_L0_4x4	4	Pred_L0	4	4

The following semantics are assigned to the sub-macroblock types in Table 7-17.

- P_L0_MxN, with MxN being replaced by 8x8, 8x4, 4x8, or 4x4: the samples of the sub-macroblock are predicted using one luma partition of size MxN equal to 8x8, two luma partitions of size MxN equal to 8x4, or two luma partitions of size MxN equal to 4x8, or four luma partitions of size MxN equal to 4x4, and associated chroma samples, respectively.

The following semantics are assigned to the sub-macroblock prediction modes (SubMbPredMode()) in Table 7-17.

- Pred_L0: see semantics for Table 7-13.

The interpretation of sub_mb_type[mbPartIdx] for B macroblock types is specified in Table 7-18, where the row for "inferred" specifies values inferred when sub_mb_type[mbPartIdx] is not present, and the inferred value "mb_type" specifies that the name of sub_mb_type[mbPartIdx] is the same as the name of mb_type for this case.

Table 7-18 – Sub-macroblock types in B macroblocks

sub_mb_type[mbPartIdx]	Name of sub_mb_type[mbPartIdx]	NumSubMbPart (sub_mb_type[mbPartIdx])	SubMbPredMode (sub_mb_type[mbPartIdx])	SubMbPartWidth (sub_mb_type[mbPartIdx])	SubMbPartHeight (sub_mb_type[mbPartIdx])
inferred	mb_type	4	Direct	4	4
0	B_Direct_8x8	4	Direct	4	4
1	B_L0_8x8	1	Pred_L0	8	8
2	B_L1_8x8	1	Pred_L1	8	8
3	B_Bi_8x8	1	BiPred	8	8
4	B_L0_8x4	2	Pred_L0	8	4
5	B_L0_4x8	2	Pred_L0	4	8
6	B_L1_8x4	2	Pred_L1	8	4
7	B_L1_4x8	2	Pred_L1	4	8
8	B_Bi_8x4	2	BiPred	8	4
9	B_Bi_4x8	2	BiPred	4	8
10	B_L0_4x4	4	Pred_L0	4	4
11	B_L1_4x4	4	Pred_L1	4	4
12	B_Bi_4x4	4	BiPred	4	4

The following semantics are assigned to the sub-macroblock types in Table 7-18:

- B_Skip and B_Direct_16x16: no motion vector differences or reference indices are present for the sub-macroblock in the bitstream. The functions SubMbPartWidth() and SubMbPartHeight() are used in the derivation process for motion vectors and reference frame indices in subclause 8.4.1 for direct mode prediction.
- B_Direct_8x8: no motion vector differences or reference indices are present for the sub-macroblock in the bitstream. The functions SubMbPartWidth(B_Direct_8x8) and SubMbPartHeight(B_Direct_8x8) are used in the derivation process for motion vectors and reference frame indices in subclause 8.4.1 for direct mode prediction.
- B_X_MxN, with X being replaced by L0, L1, or Bi, and MxN being replaced by 8x8, 8x4, 4x8 or 4x4: the samples of the sub-macroblock are predicted using one luma partition of size MxN equal to 8x8, or the samples of the sub-macroblock are predicted using two luma partitions of size MxN equal to 8x4, or the samples of the sub-macroblock are predicted using two luma partitions of size MxN equal to 4x8, or the samples of the sub-macroblock are predicted using four luma partitions of size MxN equal to 4x4, and associated chroma samples, respectively. All sub-macroblock partitions share the same reference index. For an MxN sub-macroblock partition in a sub-macroblock with sub_mb_type being B_X_MxN with X being replaced by either L0 or L1, one motion vector difference is present in the bitstream. For an MxN sub-macroblock partition in a sub-macroblock with sub_mb_type being B_Bi_MxN, two motion vector difference are present in the bitstream.

The following semantics are assigned to the sub-macroblock prediction modes (SubMbPredMode()) in Table 7-18.

- Direct: see semantics for Table 7-14.
- Pred_L0: see semantics for Table 7-13.
- Pred_L1: see semantics for Table 7-14.
- BiPred: see semantics for Table 7-14.

ref_idx_l0[mbPartIdx] has the same semantics as ref_idx_l0 in subclause 7.4.5.1.

ref_idx_l1[mbPartIdx] has the same semantics as ref_idx_l1 in subclause 7.4.5.1.

mvd_l0[mbPartIdx][subMbPartIdx][compIdx] has the same semantics as mvd_l0 in subclause 7.4.5.1, except that it is applied to the sub-macroblock partition index with subMbPartIdx. The indices mbPartIdx and subMbPartIdx specify to which macroblock partition and sub-macroblock partition mvd_l0 is assigned.

mvd_l1[mbPartIdx][subMbPartIdx][compIdx] has the same semantics as mvd_l1 in subclause 7.4.5.1.

7.4.5.3 Residual data semantics

The syntax structure residual_block(), which is used for parsing the transform coefficient levels, is assigned as follows.

- If entropy_coding_mode_flag is equal to 0, residual_block is set equal to residual_block_cavlc, which is used for parsing the syntax elements for transform coefficient levels.
- Otherwise (entropy_coding_mode_flag is equal to 1), residual_block is set equal to residual_block_cabac, which is used for parsing the syntax elements for transform coefficient levels.

Depending on mb_type, luma or chroma, and chroma format, the syntax structure residual_block(coeffLevel, maxNumCoeff) is used with the arguments coeffLevel, which is a list containing the maxNumCoeff transform coefficient levels that are parsed in residual_block() and maxNumCoeff as follows.

- Depending on MbPartPredMode(mb_type, 0), the following applies.
 - If MbPartPredMode(mb_type, 0) is equal to Intra_16x16, the transform coefficient levels are parsed into the list Intra16x16DCLevel and into the 16 lists Intra16x16ACLevel[i]. Intra16x16DCLevel contains the 16 transform coefficient levels of the DC transform coefficient levels for each 4x4 luma block. For each of the 16 4x4 luma blocks indexed by i = 0..15, the 15 AC transform coefficients levels of the i-th block are parsed into the i-th list Intra16x16ACLevel[i].
 - Otherwise (MbPartPredMode(mb_type, 0) is not equal to Intra_16x16), the following applies.
 - If transform_size_8x8_flag is equal to 0, for each of the 16 4x4 luma blocks indexed by i = 0..15, the 16 transform coefficient levels of the i-th block are parsed into the i-th list LumaLevel[i].
 - Otherwise (transform_size_8x8_flag is equal to 1), for each of the 4 8x8 luma blocks indexed by i8x8 = 0..3, the following applies.

- If `entropy_coding_mode_flag` is equal to 0, first for each of the 4 4x4 luma blocks indexed by $i_{4x4} = 0..3$, the 16 transform coefficient levels of the i_{4x4} -th block are parsed into the $(i_{8x8} * 4 + i_{4x4})$ -th list `LumaLevel[  $i_{8x8} * 4 + i_{4x4}$  ]`. Then, the 64 transform coefficient levels of the i_{8x8} -th 8x8 luma block which are indexed by $4 * i + i_{4x4}$, where $i = 0..15$ and $i_{4x4} = 0..3$, are derived as `LumaLevel8x8[i_{8x8}][$4 * i + i_{4x4}$] = LumaLevel[$i_{8x8} * 4 + i_{4x4}$][i].
NOTE – The 4x4 luma blocks with luma4x4BlkIdx = $i_{8x8} * 4 + i_{4x4}$ containing every fourth transform coefficient level of the corresponding i_{8x8} -th 8x8 luma block with offset i_{4x4} are assumed to represent spatial locations given by the inverse 4x4 luma block scanning process in subclause 6.4.3.`
- Otherwise (`entropy_coding_mode_flag` is equal to 1), the 64 transform coefficient levels of the i_{8x8} -th block are parsed into the i_{8x8} -th list `LumaLevel8x8[  $i_{8x8}$  ]`.
- For each chroma component, indexed by `iCbCr = 0..1`, the DC transform coefficient levels of the $4 * \text{NumC8x8}$ 4x4 chroma blocks are parsed into the `iCbCr`-th list `ChromaDCLevel[  $iCbCr$  ]`.
- For each of the 4x4 chroma blocks, indexed by $i_{4x4} = 0..3$ and $i_{8x8} = 0..\text{NumC8x8} - 1$, of each chroma component, indexed by `iCbCr = 0..1`, the 15 AC transform coefficient levels are parsed into the $(i_{8x8} * 4 + i_{4x4})$ -th list of the `iCbCr`-th chroma component `ChromaACLevel[  $iCbCr$  ][  $i_{8x8} * 4 + i_{4x4}$  ]`.

7.4.5.3.1 Residual block CAVLC semantics

The function `TotalCoeff( coeff_token )` that is used in subclause 7.3.5.3.1 returns the number of non-zero transform coefficient levels derived from `coeff_token`.

The function `TrailingOnes( coeff_token )` that is used in subclause 7.3.5.3.1 returns the trailing ones derived from `coeff_token`.

coeff_token specifies the total number of non-zero transform coefficient levels and the number of trailing one transform coefficient levels in a transform coefficient level scan. A trailing one transform coefficient level is one of up to three consecutive non-zero transform coefficient levels having an absolute value equal to 1 at the end of a scan of non-zero transform coefficient levels. The range of `coeff_token` is specified in subclause 9.2.1.

trailing_ones_sign_flag specifies the sign of a trailing one transform coefficient level as follows.

- If `trailing_ones_sign_flag` is equal to 0, the corresponding transform coefficient level is decoded as +1.
- Otherwise (`trailing_ones_sign_flag` equal to 1), the corresponding transform coefficient level is decoded as -1.

level_prefix and **level_suffix** specify the value of a non-zero transform coefficient level. The range of `level_prefix` and `level_suffix` is specified in subclause 9.2.2.

total_zeros specifies the total number of zero-valued transform coefficient levels that are located before the position of the last non-zero transform coefficient level in a scan of transform coefficient levels. The range of `total_zeros` is specified in subclause 9.2.3.

run_before specifies the number of consecutive transform coefficient levels in the scan with zero value before a non-zero valued transform coefficient level. The range of `run_before` is specified in subclause 9.2.3.

`coeffLevel` contains `maxNumCoeff` transform coefficient levels for the current list of transform coefficient levels.

7.4.5.3.2 Residual block CABAC semantics

coded_block_flag specifies whether the block contains non-zero transform coefficient levels as follows.

- If `coded_block_flag` is equal to 0, the block contains no non-zero transform coefficient levels.
- Otherwise (`coded_block_flag` is equal to 1), the block contains at least one non-zero transform coefficient level.

significant_coeff_flag[i] specifies whether the transform coefficient level at scanning position i is non-zero as follows.

- If `significant_coeff_flag[  $i$  ]` is equal to 0, the transform coefficient level at scanning position i is set equal to 0;
- Otherwise (`significant_coeff_flag[  $i$  ]` is equal to 1), the transform coefficient level at scanning position i has a non-zero value.

last_significant_coeff_flag[i] specifies for the scanning position i whether there are non-zero transform coefficient levels for subsequent scanning positions $i + 1$ to `maxNumCoeff` – 1 as follows.

- If `last_significant_coeff_flag[ i ]` is equal to 1, all following transform coefficient levels (in scanning order) of the block have value equal to 0..
- Otherwise (`last_significant_coeff_flag[ i ]` is equal to 0), there are further non-zero transform coefficient levels along the scanning path.

`coeff_abs_level_minus1[ i ]` is the absolute value of a transform coefficient level minus 1. The value of `coeff_abs_level_minus1` is constrained by the limits in subclause 8.5.

`coeff_sign_flag[ i ]` specifies the sign of a transform coefficient level as follows.

- If `coeff_sign_flag` is equal to 0, the corresponding transform coefficient level has a positive value.
- Otherwise (`coeff_sign_flag` is equal to 1), the corresponding transform coefficient level has a negative value.

`coeffLevel` contains `maxNumCoeff` transform coefficient levels for the current list of transform coefficient levels.

8 Decoding process

Outputs of this process are decoded samples of the current picture (sometimes referred to by the variable `CurrPic`).

This clause describes the decoding process, given syntax elements and upper-case variables from clause 7.

The decoding process is specified such that all decoders shall produce numerically identical results. Any decoding process that produces identical results to the process described here conforms to the decoding process requirements of this Recommendation | International Standard.

Each picture referred to in this clause is a primary picture. Each slice referred to in this clause is a slice of a primary picture. Each slice data partition referred to in this clause is a slice data partition of a primary picture.

An overview of the decoding process is given as follows.

- The decoding of NAL units is specified in subclause 8.1.
- The processes in subclause 8.2 specify decoding processes using syntax elements in the slice layer and above.
 - Variables and functions relating to picture order count are derived in subclause 8.2.1. (only needed to be invoked for one slice of a picture)
 - Variables and functions relating to the macroblock to slice group map are derived in subclause 8.2.2. (only needed to be invoked for one slice of a picture)
 - The method of combining the various partitions when slice data partitioning is used is described in subclause 8.2.3.
 - When the `frame_num` of the current picture is not equal to `PrevRefFrameNum` and is not equal to $(\text{PrevRefFrameNum} + 1) \% \text{MaxFrameNum}$, the decoding process for gaps in `frame_num` is performed according to subclause 8.2.5.2 prior to the decoding of any slices of the current picture.
 - At the beginning of the decoding process for each P, SP, or B slice, the decoding process for reference picture lists construction specified in subclause 8.2.4 performed for derivation of reference picture list 0 (`RefPicList0`), and when decoding a B slice, reference picture list 1 (`RefPicList1`).
 - When the current picture is a reference picture and after all slices of the current picture have been decoded, the decoded reference picture marking process in subclause 8.2.5 specifies how the current picture is used in the decoding process of inter prediction in later decoded pictures.
- The processes in subclauses 8.3, 8.4, 8.5, 8.6, and 8.7 specify decoding processes using syntax elements in the macroblock layer and above.
 - The intra prediction process for I and SI macroblocks, except for I_PCM macroblocks as specified in subclause 8.3, has intra prediction samples as its output. For I_PCM macroblocks subclause 8.3 directly specifies a picture construction process. The output are the constructed samples prior to the deblocking filter process.
 - The inter prediction process for P and B macroblocks is specified in subclause 8.4 with inter prediction samples being the output.

- The transform coefficient decoding process and picture construction process prior to deblocking filter process are specified in subclause 8.5. That process derives samples for I and B macroblocks and for P macroblocks in P slices. The output are constructed samples prior to the deblocking filter process.
- The decoding process for P macroblocks in SP slices or SI macroblocks is specified in subclause 8.6. That process derives samples for P macroblocks in SP slices and for SI macroblocks. The output are constructed samples prior to the deblocking filter process.
- The constructed samples prior to the deblocking filter process that are next to the edges of blocks and macroblocks are processed by a deblocking filter as specified in subclause 8.7 with the output being the decoded samples.

8.1 NAL unit decoding process

Inputs to this process are NAL units.

Outputs of this process are the RBSP syntax structures encapsulated within the NAL units.

The decoding process for each NAL unit extracts the RBSP syntax structure from the NAL unit and then operates the decoding processes specified for the RBSP syntax structure in the NAL unit as follows.

Subclause 8.2 describes the decoding process for NAL units with `nal_unit_type` equal to 1 through 5.

Subclauses 8.3 describes the decoding process for a macroblock or part of a macroblock coded in NAL units with `nal_unit_type` equal to 1, 2, and 5.

Subclause 8.4 describes the decoding process for a macroblock or part of a macroblock coded in NAL units with `nal_unit_type` equal to 1 and 2.

Subclause 8.5 describes the decoding process for a macroblock or part of a macroblock coded in NAL units with `nal_unit_type` equal to 1 and 3 to 5.

Subclause 8.6 describes the decoding process for a macroblock or part of a macroblock coded in NAL units with `nal_unit_type` equal to 1 and 3 to 5.

Subclause 8.7 describes the decoding process for a macroblock or part of a macroblock coded in NAL units with `nal_unit_type` equal to 1 to 5.

NAL units with `nal_unit_type` equal to 7 and 8 contain sequence parameter sets and picture parameter sets, respectively. Picture parameter sets are used in the decoding processes of other NAL units as determined by reference to a picture parameter set within the slice headers of each picture. Sequence parameter sets are used in the decoding processes of other NAL units as determined by reference to a sequence parameter set within the picture parameter sets of each sequence.

No normative decoding process is specified for NAL units with `nal_unit_type` equal to 6, 9, 10, 11, and 12.

8.2 Slice decoding process

8.2.1 Decoding process for picture order count

Outputs of this process are `TopFieldOrderCnt` (if applicable) and `BottomFieldOrderCnt` (if applicable).

Picture order counts are used to determine initial picture orderings for reference pictures in the decoding of B slices (see subclauses 8.2.4.2.3 and 8.2.4.2.4), to represent picture order differences between frames or fields for motion vector derivation in temporal direct mode (see subclause 8.4.1.2.3), for implicit mode weighted prediction in B slices (see subclause 8.4.2.3.2), and for decoder conformance checking (see subclause C.4).

Picture order count information is derived for every frame, field (whether decoded from a coded field or as a part of a decoded frame), or complementary field pair as follows:

- Each coded frame is associated with two picture order counts, called `TopFieldOrderCnt` and `BottomFieldOrderCnt` for its top field and bottom field, respectively.
- Each coded field is associated with a picture order count, called `TopFieldOrderCnt` for a coded top field and `BottomFieldOrderCnt` for a bottom field.

- Each complementary field pair is associated with two picture order counts, which are the TopFieldOrderCnt for its coded top field and the BottomFieldOrderCnt for its coded bottom field, respectively.

TopFieldOrderCnt and BottomFieldOrderCnt indicate the picture order of the corresponding top field or bottom field relative to the first output field of the previous IDR picture or the previous reference picture including a memory_management_control_operation equal to 5 in decoding order.

TopFieldOrderCnt and BottomFieldOrderCnt are derived by invoking one of the decoding processes for picture order count type 0, 1, and 2 in subclauses 8.2.1.1, 8.2.1.2, and 8.2.1.3, respectively. When the current picture includes a memory management control operation equal to 5, after the decoding of the current picture, tempPicOrderCnt is set equal to PicOrderCnt(CurrPic), TopFieldOrderCnt of the current picture (if any) is set equal to TopFieldOrderCnt - tempPicOrderCnt, and BottomFieldOrderCnt of the current picture (if any) is set equal to BottomFieldOrderCnt - tempPicOrderCnt.

The bitstream shall not contain data that results in Min(TopFieldOrderCnt, BottomFieldOrderCnt) not equal to 0 for a coded IDR frame, TopFieldOrderCnt not equal to 0 for a coded IDR top field, or BottomFieldOrderCnt not equal to 0 for a coded IDR bottom field. Thus, at least one of TopFieldOrderCnt and BottomFieldOrderCnt shall be equal to 0 for the fields of a coded IDR frame.

When the current picture is not an IDR picture, the following applies.

- Consider the list variable listD containing as elements the TopFieldOrderCnt and BottomFieldOrderCnt values associated with the list of pictures including all of the following
 - the first picture in the list is the previous picture of any of the following types
 - an IDR picture
 - a picture containing a memory_management_control_operation equal to 5
 - the following additional pictures.
 - If pic_order_cnt_type is equal to 0, all other pictures that follow in decoding order after the first picture in the list and are not "non-existing" frames inferred by the decoding process for gaps in frame_num specified in subclause 8.2.5.2 and either precede the current picture in decoding order or are the current picture. When pic_order_cnt_type is equal to 0 and the current picture is not a "non-existing" frame inferred by the decoding process for gaps in frame_num specified in subclause 8.2.5.2, the current picture is included in listD prior to the invoking of the decoded reference picture marking process.
 - Otherwise (pic_order_cnt_type is not equal to 0), all other pictures that follow in decoding order after the first picture in the list and either precede the current picture in decoding order or are the current picture. When pic_order_cnt_type is not equal to 0, the current picture is included in listD prior to the invoking of the decoded reference picture marking process.
- Consider the list variable listO which contains the elements of listD sorted in ascending order. listO shall not contain any of the following.
 - a pair of TopFieldOrderCnt and BottomFieldOrderCnt for a frame or complementary field pair that are not at consecutive positions in listO.
 - a TopFieldOrderCnt that has a value equal to another TopFieldOrderCnt.
 - a BottomFieldOrderCnt that has a value equal to another BottomFieldOrderCnt.
 - a BottomFieldOrderCnt that has a value equal to a TopFieldOrderCnt unless the BottomFieldOrderCnt and TopFieldOrderCnt belong to the same coded frame or complementary field pair.

The bitstream shall not contain data that results in values of TopFieldOrderCnt, BottomFieldOrderCnt, PicOrderCntMsb, or FrameNumOffset used in the decoding process as specified in subclauses 8.2.1.1 to 8.2.1.3 that exceed the range of values from -2^{31} to $2^{31}-1$, inclusive.

The function $\text{PicOrderCnt}(\text{picX})$ is specified as follows:

```

if( picX is a frame or a complementary field pair )
    PicOrderCnt( picX ) = Min( TopFieldOrderCnt, BottomFieldOrderCnt ) of the frame or complementary field
    pair picX
else if( picX is a top field )
    PicOrderCnt( picX ) = TopFieldOrderCnt of field picX
else if( picX is a bottom field )
    PicOrderCnt( picX ) = BottomFieldOrderCnt of field picX

```

(8-1)

Then $\text{DiffPicOrderCnt}(\text{picA}, \text{picB})$ is specified as follows:

$$\text{DiffPicOrderCnt}(\text{picA}, \text{picB}) = \text{PicOrderCnt}(\text{picA}) - \text{PicOrderCnt}(\text{picB}) \quad (8-2)$$

The bitstream shall not contain data that results in values of $\text{DiffPicOrderCnt}(\text{picA}, \text{picB})$ used in the decoding process that exceed the range of -2^{15} to $2^{15} - 1$, inclusive.

NOTE – Let X be the current picture and Y and Z be two other pictures in the same sequence, Y and Z are considered to be in the same output order direction from X when both $\text{DiffPicOrderCnt}(X, Y)$ and $\text{DiffPicOrderCnt}(X, Z)$ are positive or both are negative.

NOTE – Many applications assign $\text{PicOrderCnt}(X)$ proportional to the sampling time of the picture X relative to the sampling time of an IDR picture.

When the current picture includes a `memory_management_control_operation` equal to 5, $\text{PicOrderCnt}(\text{CurrPic})$ shall be greater than $\text{PicOrderCnt}(\text{any other picture in listD})$.

8.2.1.1 Decoding process for picture order count type 0

This process is invoked when `pic_order_cnt_type` is equal to 0.

Input to this process is PicOrderCntMsb of the previous reference picture in decoding order as specified in this subclause.

Outputs of this process are either or both `TopFieldOrderCnt` or `BottomFieldOrderCnt`.

The variables $\text{prevPicOrderCntMsb}$ and $\text{prevPicOrderCntLsb}$ are derived as follows.

- If the current picture is an IDR picture, $\text{prevPicOrderCntMsb}$ is set equal to 0 and $\text{prevPicOrderCntLsb}$ is set equal to 0.
- Otherwise (the current picture is not an IDR picture), the following applies.
 - If the previous reference picture in decoding order included a `memory_management_control_operation` equal to 5, the following applies.
 - If the previous reference picture in decoding order is not a bottom field, $\text{prevPicOrderCntMsb}$ is set equal to 0 and $\text{prevPicOrderCntLsb}$ is set equal to the value of `TopFieldOrderCnt` for the previous reference picture in decoding order.
 - Otherwise (the previous reference picture in decoding order is a bottom field), $\text{prevPicOrderCntMsb}$ is set equal to 0 and $\text{prevPicOrderCntLsb}$ is set equal to 0.
 - Otherwise (the previous reference picture in decoding order did not include a `memory_management_control_operation` equal to 5), $\text{prevPicOrderCntMsb}$ is set equal to PicOrderCntMsb of the previous reference picture in decoding order and $\text{prevPicOrderCntLsb}$ is set equal to the value of `pic_order_cnt_lsb` of the previous reference picture in decoding order.

PicOrderCntMsb of the current picture is derived as follows:

```

if( ( pic_order_cnt_lsb < prevPicOrderCntLsb ) &&
    ( ( prevPicOrderCntLsb - pic_order_cnt_lsb ) >= ( MaxPicOrderCntLsb / 2 ) ) )
    PicOrderCntMsb = prevPicOrderCntMsb + MaxPicOrderCntLsb
else if( ( pic_order_cnt_lsb > prevPicOrderCntLsb ) &&
    ( ( pic_order_cnt_lsb - prevPicOrderCntLsb ) > ( MaxPicOrderCntLsb / 2 ) ) )
    PicOrderCntMsb = prevPicOrderCntMsb - MaxPicOrderCntLsb
else
    PicOrderCntMsb = prevPicOrderCntMsb

```

(8-3)

When the current picture is not a bottom field, TopFieldOrderCnt is derived as follows:

```
if( !field_pic_flag || !bottom_field_flag )
    TopFieldOrderCnt = PicOrderCntMsb + pic_order_cnt_lsb
```

 (8-4)

When the current picture is not a top field, BottomFieldOrderCnt is derived as follows:

```
if( !field_pic_flag )
    BottomFieldOrderCnt = TopFieldOrderCnt + delta_pic_order_cnt_bottom
else if( bottom_field_flag )
    BottomFieldOrderCnt = PicOrderCntMsb + pic_order_cnt_lsb
```

 (8-5)

8.2.1.2 Decoding process for picture order count type 1

This process is invoked when pic_order_cnt_type is equal to 1.

Input to this process is FrameNumOffset of the previous picture in decoding order as specified in this subclause.

Outputs of this process are either or both TopFieldOrderCnt or BottomFieldOrderCnt.

The values of TopFieldOrderCnt and BottomFieldOrderCnt are derived as specified in this subclause. Let prevFrameNum be equal to the frame_num of the previous picture in decoding order.

When the current picture is not an IDR picture, the variable prevFrameNumOffset is derived as follows.

- If the previous picture in decoding order included a memory_management_control_operation equal to 5, prevFrameNumOffset is set equal to 0.
- Otherwise (the previous picture in decoding order did not include a memory_management_control_operation equal to 5), prevFrameNumOffset is set equal to the value of FrameNumOffset of the previous picture in decoding order.

NOTE – When gaps_in_frame_num_value_allowed_flag is equal to 1, the previous picture in decoding order may be a "non-existing" frame inferred by the decoding process for gaps in frame_num specified in subclause 8.2.5.2.

The derivation proceeds in the following ordered steps.

1. The variable FrameNumOffset is derived as follows:

```
if( nal_unit_type == 5 )
    FrameNumOffset = 0
else if( prevFrameNum > frame_num )
    FrameNumOffset = prevFrameNumOffset + MaxFrameNum
else
    FrameNumOffset = prevFrameNumOffset
```

 (8-6)

2. The variable absFrameNum is derived as follows:

```
if( num_ref_frames_in_pic_order_cnt_cycle != 0 )
    absFrameNum = FrameNumOffset + frame_num
else
    absFrameNum = 0
if( nal_ref_idc == 0 && absFrameNum > 0 )
    absFrameNum = absFrameNum - 1
```

 (8-7)

3. When absFrameNum > 0, picOrderCntCycleCnt and frameNumInPicOrderCntCycle are derived as follows:

```
if( absFrameNum > 0 ) {
    picOrderCntCycleCnt = ( absFrameNum - 1 ) / num_ref_frames_in_pic_order_cnt_cycle
    frameNumInPicOrderCntCycle = ( absFrameNum - 1 ) % num_ref_frames_in_pic_order_cnt_cycle
}
```

 (8-8)

4. The variable `expectedDeltaPerPicOrderCntCycle` is derived as follows:

```

expectedDeltaPerPicOrderCntCycle = 0
for( i = 0; i < num_ref_frames_in_pic_order_cnt_cycle; i++ )
    expectedDeltaPerPicOrderCntCycle += offset_for_ref_frame[ i ]

```

(8-9)

5. The variable `expectedPicOrderCnt` is derived as follows:

```

if( absFrameNum > 0 ){
    expectedPicOrderCnt = picOrderCntCycleCnt * expectedDeltaPerPicOrderCntCycle
    for( i = 0; i <= frameNumInPicOrderCntCycle; i++ )
        expectedPicOrderCnt = expectedPicOrderCnt + offset_for_ref_frame[ i ]
} else
    expectedPicOrderCnt = 0
if( nal_ref_idc == 0 )
    expectedPicOrderCnt = expectedPicOrderCnt + offset_for_non_ref_pic

```

(8-10)

6. The variables `TopFieldOrderCnt` or `BottomFieldOrderCnt` are derived as follows:

```

if( !field_pic_flag ) {
    TopFieldOrderCnt = expectedPicOrderCnt + delta_pic_order_cnt[ 0 ]
    BottomFieldOrderCnt = TopFieldOrderCnt +
        offset_for_top_to_bottom_field + delta_pic_order_cnt[ 1 ]
} else if( !bottom_field_flag )
    TopFieldOrderCnt = expectedPicOrderCnt + delta_pic_order_cnt[ 0 ]
else
    BottomFieldOrderCnt = expectedPicOrderCnt + offset_for_top_to_bottom_field + delta_pic_order_cnt[ 0 ]

```

(8-11)

8.2.1.3 Decoding process for picture order count type 2

This process is invoked when `pic_order_cnt_type` is equal to 2.

Outputs of this process are either or both `TopFieldOrderCnt` or `BottomFieldOrderCnt`.

Let `prevFrameNum` be equal to the `frame_num` of the previous picture in decoding order.

When the current picture is not an IDR picture, the variable `prevFrameNumOffset` is derived as follows.

- If the previous picture in decoding order included a `memory_management_control_operation` equal to 5, `prevFrameNumOffset` is set equal to 0.
- Otherwise (the previous picture in decoding order did not include a `memory_management_control_operation` equal to 5), `prevFrameNumOffset` is set equal to the value of `FrameNumOffset` of the previous picture in decoding order.

NOTE – When `gaps_in_frame_num_value_allowed_flag` is equal to 1, the previous picture in decoding order may be a "non-existing" frame inferred by the decoding process for gaps in `frame_num` specified in subclause 8.2.5.2.

The variable `FrameNumOffset` is derived as follows.

```

if( nal_unit_type == 5 )
    FrameNumOffset = 0
else if( prevFrameNum > frame_num )
    FrameNumOffset = prevFrameNumOffset + MaxFrameNum
else
    FrameNumOffset = prevFrameNumOffset

```

(8-12)

The variable `tempPicOrderCnt` is derived as follows:

```

if( nal_unit_type == 5 )
    tempPicOrderCnt = 0
else if( nal_ref_idc == 0 )
    tempPicOrderCnt = 2 * ( FrameNumOffset + frame_num ) - 1
else
    tempPicOrderCnt = 2 * ( FrameNumOffset + frame_num )

```

(8-13)

The variables TopFieldOrderCnt or BottomFieldOrderCnt are derived as follows:

```

if( !field_pic_flag ) {
    TopFieldOrderCnt = tempPicOrderCnt
    BottomFieldOrderCnt = tempPicOrderCnt
} else if( bottom_field_flag )
    BottomFieldOrderCnt = tempPicOrderCnt
else
    TopFieldOrderCnt = tempPicOrderCnt

```

(8-14)

NOTE – Picture order count type 2 cannot be used in a coded video sequence that contains consecutive non-reference pictures that would result in more than one of these pictures having the same value of TopFieldOrderCnt or more than one of these pictures having the same value of BottomFieldOrderCnt.

NOTE – Picture order count type 2 results in an output order that is the same as the decoding order.

8.2.2 Decoding process for macroblock to slice group map

Inputs to this process are the active picture parameter set and the slice header of the slice to be decoded.

Output of this process is a macroblock to slice group map MbToSliceGroupMap.

This process is invoked at the start of every slice.

NOTE – The output of this process is equal for all slices of a picture.

When num_slice_groups_minus1 is equal to 1 and slice_group_map_type is equal to 3, 4, or 5, slice groups 0 and 1 have a size and shape determined by slice_group_change_direction_flag as shown in Table 8-1 and specified in subclauses 8.2.2.4 to 8.2.2.6.

Table 8-1 – Refined slice group map type

slice_group_map_type	slice_group_change_direction_flag	refined slice group map type
3	0	Box-out clockwise
3	1	Box-out counter-clockwise
4	0	Raster scan
4	1	Reverse raster scan
5	0	Wipe right
5	1	Wipe left

In such a case, MapUnitsInSliceGroup0 slice group map units in the specified growth order are allocated for slice group 0 and the remaining PicSizeInMapUnits – MapUnitsInSliceGroup0 slice group map units of the picture are allocated for slice group 1.

When num_slice_groups_minus1 is equal to 1 and slice_group_map_type is equal to 4 or 5, the variable sizeOfUpperLeftGroup is defined as follows:

$$\text{sizeOfUpperLeftGroup} = (\text{slice_group_change_direction_flag} ? \\ (\text{PicSizeInMapUnits} - \text{MapUnitsInSliceGroup0}) : \text{MapUnitsInSliceGroup0}) \quad (8-15)$$

The variable mapUnitToSliceGroupMap is derived as follows.

- If num_slice_groups_minus1 is equal to 0, the map unit to slice group map is generated for all i ranging from 0 to PicSizeInMapUnits – 1, inclusive, as specified by:

$$\text{mapUnitToSliceGroupMap}[i] = 0 \quad (8-16)$$

- Otherwise (num_slice_groups_minus1 is not equal to 0), mapUnitToSliceGroupMap is derived as follows.
 - If slice_group_map_type is equal to 0, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.1 applies.

- Otherwise, if slice_group_map_type is equal to 1, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.2 applies.
- Otherwise, if slice_group_map_type is equal to 2, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.3 applies.
- Otherwise, if slice_group_map_type is equal to 3, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.4 applies.
- Otherwise, if slice_group_map_type is equal to 4, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.5 applies.
- Otherwise, if slice_group_map_type is equal to 5, the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.6 applies.
- Otherwise (slice_group_map_type is equal to 6), the derivation of mapUnitToSliceGroupMap as specified in subclause 8.2.2.7 applies.

After derivation of the mapUnitToSliceGroupMap, the process specified in subclause 8.2.2.8 is invoked to convert the map unit to slice group map mapUnitToSliceGroupMap to the macroblock to slice group map MbToSliceGroupMap. After derivation of the macroblock to slice group map as specified in subclause 8.2.2.8, the function NextMbAddress(n) is defined as the value of the variable nextMbAddress derived as specified by:

```
i = n + 1
while( i < PicSizeInMbs && MbToSliceGroupMap[ i ] != MbToSliceGroupMap[ n ] )
    i++;
nextMbAddress = i
```

(8-17)

8.2.2.1 Specification for interleaved slice group map type

The specifications in this subclause apply when slice_group_map_type is equal to 0.

The map unit to slice group map is generated as specified by:

```
i = 0
do
    for( iGroup = 0; iGroup <= num_slice_groups_minus1 && i < PicSizeInMapUnits;
        i += run_length_minus1[ iGroup++ ] + 1 )
        for( j = 0; j <= run_length_minus1[ iGroup ] && i + j < PicSizeInMapUnits; j++ )
            mapUnitToSliceGroupMap[ i + j ] = iGroup
    while( i < PicSizeInMapUnits )
```

(8-18)

8.2.2.2 Specification for dispersed slice group map type

The specifications in this subclause apply when slice_group_map_type is equal to 1.

The map unit to slice group map is generated as specified by:

```
for( i = 0; i < PicSizeInMapUnits; i++ )
    mapUnitToSliceGroupMap[ i ] = ( ( i % PicWidthInMbs ) +
        ( ( i / PicWidthInMbs ) * ( num_slice_groups_minus1 + 1 ) ) / 2 )
        % ( num_slice_groups_minus1 + 1 )
```

(8-19)

8.2.2.3 Specification for foreground with left-over slice group map type

The specifications in this subclause apply when slice_group_map_type is equal to 2.

The map unit to slice group map is generated as specified by:

```
for( i = 0; i < PicSizeInMapUnits; i++ )
    mapUnitToSliceGroupMap[ i ] = num_slice_groups_minus1
for( iGroup = num_slice_groups_minus1 - 1; iGroup >= 0; iGroup-- ) {
    yTopLeft = top_left[ iGroup ] / PicWidthInMbs
    xTopLeft = top_left[ iGroup ] % PicWidthInMbs
    yBottomRight = bottom_right[ iGroup ] / PicWidthInMbs
    xBottomRight = bottom_right[ iGroup ] % PicWidthInMbs
```

```

for( y = yTopLeft; y <= yBottomRight; y++ )
    for( x = xTopLeft; x <= xBottomRight; x++ )
        mapUnitToSliceGroupMap[ y * PicWidthInMbs + x ] = iGroup
}

```

(8-20)

NOTE – The rectangles may overlap. Slice group 0 contains the macroblocks that are within the rectangle specified by `top_left[ 0 ]` and `bottom_right[ 0 ]`. A slice group having slice group ID greater than 0 and less than `num_slice_groups_minus1` contains the macroblocks that are within the specified rectangle for that slice group that are not within the rectangle specified for any slice group having a smaller slice group ID. The slice group with slice group ID equal to `num_slice_groups_minus1` contains the macroblocks that are not in the other slice groups.

8.2.2.4 Specification for box-out slice group map types

The specifications in this subclause apply when `slice_group_map_type` is equal to 3.

The map unit to slice group map is generated as specified by:

```

for( i = 0; i < PicSizeInMapUnits; i++ )
    mapUnitToSliceGroupMap[ i ] = 1
x = ( PicWidthInMbs - slice_group_change_direction_flag ) / 2
y = ( PicHeightInMapUnits - slice_group_change_direction_flag ) / 2
( leftBound, topBound ) = ( x, y )
( rightBound, bottomBound ) = ( x, y )
( xDir, yDir ) = ( slice_group_change_direction_flag - 1, slice_group_change_direction_flag )
for( k = 0; k < MapUnitsInSliceGroup0; k += mapUnitVacant ) {
    mapUnitVacant = ( mapUnitToSliceGroupMap[ y * PicWidthInMbs + x ] == 1 )
    if( mapUnitVacant )
        mapUnitToSliceGroupMap[ y * PicWidthInMbs + x ] = 0
    if( xDir == -1 && x == leftBound ) {
        leftBound = Max( leftBound - 1, 0 )
        x = leftBound
        ( xDir, yDir ) = ( 0, 2 * slice_group_change_direction_flag - 1 )
    } else if( xDir == 1 && x == rightBound ) {
        rightBound = Min( rightBound + 1, PicWidthInMbs - 1 )
        x = rightBound
        ( xDir, yDir ) = ( 0, 1 - 2 * slice_group_change_direction_flag )
    } else if( yDir == -1 && y == topBound ) {
        topBound = Max( topBound - 1, 0 )
        y = topBound
        ( xDir, yDir ) = ( 1 - 2 * slice_group_change_direction_flag, 0 )
    } else if( yDir == 1 && y == bottomBound ) {
        bottomBound = Min( bottomBound + 1, PicHeightInMapUnits - 1 )
        y = bottomBound
        ( xDir, yDir ) = ( 2 * slice_group_change_direction_flag - 1, 0 )
    } else
        ( x, y ) = ( x + xDir, y + yDir )
}

```

(8-21)

8.2.2.5 Specification for raster scan slice group map types

The specifications in this subclause apply when `slice_group_map_type` is equal to 4.

The map unit to slice group map is generated as specified by:

```

for( i = 0; i < PicSizeInMapUnits; i++ )
    if( i < sizeOfUpperLeftGroup )
        mapUnitToSliceGroupMap[ i ] = slice_group_change_direction_flag
    else
        mapUnitToSliceGroupMap[ i ] = 1 - slice_group_change_direction_flag

```

(8-22)

8.2.2.6 Specification for wipe slice group map types

The specifications in this subclause apply when `slice_group_map_type` is equal to 5.

The map unit to slice group map is generated as specified by:

```

k = 0;
for( j = 0; j < PicWidthInMbs; j++ )
  for( i = 0; i < PicHeightInMapUnits; i++ )
    if( k++ < sizeOfUpperLeftGroup )
      mapUnitToSliceGroupMap[ i * PicWidthInMbs + j ] = slice_group_change_direction_flag
    else
      mapUnitToSliceGroupMap[ i * PicWidthInMbs + j ] = 1 - slice_group_change_direction_flag

```

(8-23)

8.2.2.7 Specification for explicit slice group map type

The specifications in this subclause apply when slice_group_map_type is equal to 6.

The map unit to slice group map is generated as specified by:

$$\text{mapUnitToSliceGroupMap}[i] = \text{slice_group_id}[i] \quad (8-24)$$

for all i ranging from 0 to $\text{PicSizeInMapUnits} - 1$, inclusive.

8.2.2.8 Specification for conversion of map unit to slice group map to macroblock to slice group map

For each value of i ranging from 0 to $\text{PicSizeInMbs} - 1$, inclusive, the macroblock to slice group map is specified as follows.

- If frame_mbs_only_flag is equal to 1 or field_pic_flag is equal to 1, the macroblock to slice group map is specified by:

$$\text{MbToSliceGroupMap}[i] = \text{mapUnitToSliceGroupMap}[i] \quad (8-25)$$

- Otherwise, if MbaffFrameFlag is equal to 1, the macroblock to slice group map is specified by:

$$\text{MbToSliceGroupMap}[i] = \text{mapUnitToSliceGroupMap}[i / 2] \quad (8-26)$$

- Otherwise (frame_mbs_only_flag is equal to 0 and mb_adaptive_frame_field_flag is equal to 0 and field_pic_flag is equal to 0), the macroblock to slice group map is specified by:

$$\text{MbToSliceGroupMap}[i] = \text{mapUnitToSliceGroupMap}[(i / (2 * \text{PicWidthInMbs})) * \text{PicWidthInMbs} + (i \% \text{PicWidthInMbs})] \quad (8-27)$$

8.2.3 Decoding process for slice data partitioning

Inputs to this process are

- a slice data partition A layer RBSP,
- when syntax elements of category 3 are present in the slice data, a slice data partition B layer RBSP having the same slice_id as in the slice data partition A layer RBSP, and
- when syntax elements of category 4 are present in the slice data, a slice data partition C layer RBSP having the same slice_id as in the slice data partition A layer RBSP.

NOTE – The slice data partition B layer RBSP and slice data partition C layer RBSP need not be present.

Output of this process is a coded slice.

When slice data partitioning is not used, coded slices are represented by a slice layer without partitioning RBSP that contains a slice header followed by a slice data syntax structure that contains all the syntax elements of categories 2, 3, and 4 (see category column in subclause 7.3) of the macroblock data for the macroblocks of the slice.

When slice data partitioning is used, the macroblock data of a slice is partitioned into one to three partitions contained in separate NAL units. Partition A contains a slice data partition A header, and all syntax elements of category 2. Partition B, when present, contains a slice data partition B header and all syntax elements of category 3. Partition C, when present, contains a slice data partition C header and all syntax elements of category 4.

When slice data partitioning is used, the syntax elements of each category are parsed from a separate NAL unit, which need not be present when no symbols of the respective category exist. The decoding process shall process the slice data partitions of a coded slice in a manner equivalent to processing a corresponding slice layer without partitioning RBSP by extracting each syntax element from the slice data partition in which the syntax element appears depending on the slice data partition assignment in the syntax tables in subclause 7.3.

NOTE - Syntax elements of category 3 are relevant to the decoding of residual data of I and SI macroblock types. Syntax elements of category 4 are relevant to the decoding of residual data of P and B macroblock types. Category 2 encompasses all other syntax elements related to the decoding of macroblocks, and their information is often denoted as header information. The slice data partition A header contains all the syntax elements of the slice header, and additionally a slice_id that are used to associate the slice data partitions B and C with the slice data partition A. The slice data partition B and C headers contain the slice_id syntax element that establishes their association with the slice data partition A of the slice.

8.2.4 Decoding process for reference picture lists construction

This process is invoked at the beginning of decoding of each P, SP, or B slice.

Decoded reference pictures are marked as "used for short-term reference" or "used for long-term reference" as specified by the bitstream and specified in subclause 8.2.5. Short-term reference pictures are identified by the value of frame_num. Long-term reference pictures are assigned a long-term frame index as specified by the bitstream and specified in subclause 8.2.5.

Subclause 8.2.4.1 is invoked to specify

- the assignment of variables FrameNum, FrameNumWrap, and PicNum to each of the short-term reference pictures, and
- the assignment of variable LongTermPicNum to each of the long-term reference pictures.

Reference pictures are addressed through reference indices as specified in subclause 8.4.2.1. A reference index is an index into a reference picture list. When decoding a P or SP slice, there is a single reference picture list RefPicList0. When decoding a B slice, there is a second independent reference picture list RefPicList1 in addition to RefPicList0.

At the beginning of decoding of each slice, reference picture list RefPicList0, and for B slices RefPicList1, are derived as follows.

- An initial reference picture list RefPicList0 and for B slices RefPicList1 are derived as specified in subclause 8.2.4.2.
- The initial reference picture list RefPicList0 and for B slices RefPicList1 are modified as specified in subclause 8.2.4.3.

The number of entries in the modified reference picture list RefPicList0 is num_ref_idx_l0_active_minus1 + 1, and for B slices the number of entries in the modified reference picture list RefPicList1 is num_ref_idx_l1_active_minus1 + 1. A reference picture may appear at more than one index in the modified reference picture lists RefPicList0 or RefPicList1.

8.2.4.1 Decoding process for picture numbers

This process is invoked when the decoding process for reference picture lists construction specified in subclause 8.2.4 or the decoded reference picture marking process specified in subclause 8.2.5 is invoked.

The variables FrameNum, FrameNumWrap, PicNum, LongTermFrameIdx, and LongTermPicNum are used for the initialisation process for reference picture lists in subclause 8.2.4.2, the modification process for reference picture lists in subclause 8.2.4.3, and for the decoded reference picture marking process in subclause 8.2.5.

To each short-term reference picture the variables FrameNum and FrameNumWrap are assigned as follows. First, FrameNum is set equal to the syntax element frame_num that has been decoded in the slice header(s) of the corresponding short-term reference picture. Then the variable FrameNumWrap is derived as

```

if( FrameNum > frame_num )
    FrameNumWrap = FrameNum - MaxFrameNum
else
    FrameNumWrap = FrameNum
    
```

(8-28)

where the value of `frame_num` used in Equation 8-28 is the `frame_num` in the slice header(s) for the current picture.

Each long-term reference picture has an associated value of `LongTermFrameIdx` (that was assigned to it as specified in subclause 8.2.5).

To each short-term reference picture a variable `PicNum` is assigned, and to each long-term reference picture a variable `LongTermPicNum` is assigned. The values of these variables depend on the value of `field_pic_flag` and `bottom_field_flag` for the current picture and they are set as follows.

- If `field_pic_flag` is equal to 0, the following applies.

- For each short-term reference frame or complementary reference field pair:

$$\text{PicNum} = \text{FrameNumWrap} \quad (8-29)$$

- For each long-term reference frame or long-term complementary reference field pair:

$$\text{LongTermPicNum} = \text{LongTermFrameIdx} \quad (8-30)$$

NOTE – When decoding a frame the value of `MbaffFrameFlag` has no influence on the derivations in subclauses 8.2.4.2, 8.2.4.3, and 8.2.5.

- Otherwise (`field_pic_flag` is equal to 1), the following applies.

- For each short-term reference field the following applies.

- If the reference field has the same parity as the current field

$$\text{PicNum} = 2 * \text{FrameNumWrap} + 1 \quad (8-31)$$

- Otherwise (the reference field has the opposite parity of the current field),

$$\text{PicNum} = 2 * \text{FrameNumWrap} \quad (8-32)$$

- For each long-term reference field the following applies.

- If the reference field has the same parity as the current field

$$\text{LongTermPicNum} = 2 * \text{LongTermFrameIdx} + 1 \quad (8-33)$$

- Otherwise (the reference field has the opposite parity of the current field),

$$\text{LongTermPicNum} = 2 * \text{LongTermFrameIdx} \quad (8-34)$$

8.2.4.2 Initialisation process for reference picture lists

This initialisation process is invoked when decoding a P, SP, or B slice header.

`RefPicList0` and `RefPicList1` have initial entries as specified in subclauses 8.2.4.2.1 through 8.2.4.2.5.

When the number of entries in the initial `RefPicList0` or `RefPicList1` produced as specified in subclauses 8.2.4.2.1 through 8.2.4.2.5 is greater than `num_ref_idx_l0_active_minus1 + 1` or `num_ref_idx_l1_active_minus1 + 1`, respectively, the extra entries past position `num_ref_idx_l0_active_minus1` or `num_ref_idx_l1_active_minus1` are discarded from the initial reference picture list.

When the number of entries in the initial `RefPicList0` or `RefPicList1` produced as specified in subclauses 8.2.4.2.1 through 8.2.4.2.5 is less than `num_ref_idx_l0_active_minus1 + 1` or `num_ref_idx_l1_active_minus1 + 1`, respectively, the remaining entries in the initial reference picture list are set equal to "no reference picture".

8.2.4.2.1 Initialisation process for the reference picture list for P and SP slices in frames

This initialisation process is invoked when decoding a P or SP slice in a coded frame.

When this process is invoked, there shall be at least one reference frame or complementary reference field pair that is currently marked as "used for short-term reference" or "used for long-term reference".

The reference picture list RefPicList0 is ordered so that short-term reference frames and short-term complementary reference field pairs have lower indices than long-term reference frames and long-term complementary reference field pairs.

The short-term reference frames and complementary reference field pairs are ordered starting with the frame or complementary field pair with the highest PicNum value and proceeding through in descending order to the frame or complementary field pair with the lowest PicNum value.

The long-term reference frames and complementary reference field pairs are ordered starting with the frame or complementary field pair with the lowest LongTermPicNum value and proceeding through in ascending order to the frame or complementary field pair with the highest LongTermPicNum value.

NOTE – A non-paired reference field is not used for inter prediction for decoding a frame, regardless of the value of MbaffFrameFlag.

For example, when three reference frames are marked as "used for short-term reference" with PicNum equal to 300, 302, and 303 and two reference frames are marked as "used for long-term reference" with LongTermPicNum equal to 0 and 3, the initial index order is:

- RefPicList0[0] is set equal to the short-term reference picture with PicNum = 303,
- RefPicList0[1] is set equal to the short-term reference picture with PicNum = 302,
- RefPicList0[2] is set equal to the short-term reference picture with PicNum = 300,
- RefPicList0[3] is set equal to the long-term reference picture with LongTermPicNum = 0, and
- RefPicList0[4] is set equal to the long-term reference picture with LongTermPicNum = 3.

8.2.4.2.2 Initialisation process for the reference picture list for P and SP slices in fields

This initialisation process is invoked when decoding a P or SP slice in a coded field.

Each field included in the reference picture list RefPicList0 has a separate index in the reference picture list RefPicList0.

NOTE - When decoding a field, there are effectively at least twice as many pictures available for referencing as there would be when decoding a frame at the same position in decoding order.

Two ordered lists of reference frames, refFrameList0ShortTerm and refFrameList0LongTerm, are derived as follows. For purposes of the formation of this list of frames, decoded reference frames, complementary reference field pairs, non-paired reference fields and reference frames in which a single field is marked "used for short-term reference" or "used for long-term reference" are all considered reference frames.

- All frames having one or more fields marked "used for short-term reference" are included in the list of short-term reference frames refFrameList0ShortTerm. When the current field is the second field (in decoding order) of a complementary reference field pair and the first field is marked as "used for short-term reference", the first field is included in the list of short-term reference frames refFrameList0ShortTerm. refFrameList0ShortTerm is ordered starting with the reference frame with the highest FrameNumWrap value and proceeding through in descending order to the reference frame with the lowest FrameNumWrap value.
- All frames having one or more fields marked "used for long-term reference" are included in the list of long-term reference frames refFrameList0LongTerm. When the current field is the second field (in decoding order) of a complementary reference field pair and the first field is marked as "used for long-term reference", the first field is included in the list of long-term reference frames refFrameList0LongTerm. refFrameList0LongTerm is ordered starting with the reference frame with the lowest LongTermFrameIdx value and proceeding through in ascending order to the reference frame with the highest LongTermFrameIdx value.

The process specified in subclause 8.2.4.2.5 is invoked with refFrameList0ShortTerm and refFrameList0LongTerm given as input and the output is assigned to RefPicList0.

8.2.4.2.3 Initialisation process for reference picture lists for B slices in frames

This initialisation process is invoked when decoding a B slice in a coded frame.

For purposes of the formation of the reference picture lists RefPicList0 and RefPicList1 the term reference entry refers in the following to decoded reference frames or complementary reference field pairs.

When this process is invoked, there shall be at least one reference entry that is currently marked as "used for short-term reference" or "used for long-term reference".

For B slices, the order of short-term reference entries in the reference picture lists RefPicList0 and RefPicList1 depends on output order, as given by PicOrderCnt(). When pic_order_cnt_type is equal to 0, reference pictures that are marked as "non-existing" as specified in subclause 8.2.5.2 are not included in either RefPicList0 or RefPicList1.

NOTE – When gaps_in_frame_num_value_allowed_flag is equal to 1, encoders should use reference picture list reordering to ensure proper operation of the decoding process (particularly when pic_order_cnt_type is equal to 0, in which case PicOrderCnt() is not inferred for "non-existing" frames).

The reference picture list RefPicList0 is ordered such that short-term reference entries have lower indices than long-term reference entries. It is ordered as follows.

- Let entryShortTerm be a variable ranging over all reference entries that are currently marked as "used for short-term reference". When some values of entryShortTerm are present having PicOrderCnt(entryShortTerm) less than PicOrderCnt(CurrPic), these values of entryShortTerm are placed at the beginning of refPicList0 in descending order of PicOrderCnt(entryShortTerm). All of the remaining values of entryShortTerm (when present) are then appended to refPicList0 in ascending order of PicOrderCnt(entryShortTerm).
- The long-term reference entries are ordered starting with the long-term reference entry that has the lowest LongTermPicNum value and proceeding through in ascending order to the long-term reference entry that has the highest LongTermPicNum value.

The reference picture list RefPicList1 is ordered so that short-term reference entries have lower indices than long-term reference entries. It is ordered as follows.

- Let entryShortTerm be a variable ranging over all reference entries that are currently marked as "used for short-term reference". When some values of entryShortTerm are present having PicOrderCnt(entryShortTerm) greater than PicOrderCnt(CurrPic), these values of entryShortTerm are placed at the beginning of refPicList1 in ascending order of PicOrderCnt(entryShortTerm). All of the remaining values of entryShortTerm (when present) are then appended to refPicList1 in descending order of PicOrderCnt(entryShortTerm).
- Long-term reference entries are ordered starting with the long-term reference frame or complementary reference field pair that has the lowest LongTermPicNum value and proceeding through in ascending order to the long-term reference entry that has the highest LongTermPicNum value.
- When the reference picture list RefPicList1 has more than one entry and RefPicList1 is identical to the reference picture list RefPicList0, the first two entries RefPicList1[0] and RefPicList1[1] are switched.

NOTE – A non-paired reference field is not used for inter prediction of frames (independent of the value of MbaffFrameFlag).

8.2.4.2.4 Initialisation process for reference picture lists for B slices in fields

This initialisation process is invoked when decoding a B slice in a coded field.

When decoding a field, each field of a stored reference frame is identified as a separate reference picture with a unique index. The order of short-term reference pictures in the reference picture lists RefPicList0 and RefPicList1 depend on output order, as given by PicOrderCnt(). When pic_order_cnt_type is equal to 0, reference pictures that are marked as "non-existing" as specified in subclause 8.2.5.2 are not included in either RefPicList0 or RefPicList1.

NOTE – When gaps_in_frame_num_value_allowed_flag is equal to 1, encoders should use reference picture list reordering to ensure proper operation of the decoding process (particularly when pic_order_cnt_type is equal to 0, in which case PicOrderCnt() is not inferred for "non-existing" frames).

NOTE – When decoding a field, there are effectively at least twice as many pictures available for referencing as there would be when decoding a frame at the same position in decoding order.

Three ordered lists of reference frames, refFrameList0ShortTerm, refFrameList1ShortTerm and refFrameListLongTerm, are derived as follows. For purposes of the formation of these lists of frames the term reference entry refers in the following to decoded reference frames, complementary reference field pairs, or non-paired reference fields. When pic_order_cnt_type is equal to 0, the term reference entry does not refer to frames that are marked as "non-existing" as specified in subclause 8.2.5.2.

- Let entryShortTerm be a variable ranging over all reference entries that are currently marked as "used for short-term reference". When some values of entryShortTerm are present having PicOrderCnt(entryShortTerm) less than or equal to PicOrderCnt(CurrPic), these values of entryShortTerm are placed at the beginning of refFrameList0ShortTerm in descending order of PicOrderCnt(entryShortTerm). All of the remaining values of entryShortTerm (when present) are then appended to refFrameList0ShortTerm in ascending order of PicOrderCnt(entryShortTerm).

NOTE - When the current field follows in decoding order a coded field `fldPrev` with which together it forms a complementary reference field pair, `fldPrev` is included into the list `refFrameList0ShortTerm` using `PicOrderCnt( fldPrev )` and the ordering method described in the previous sentence is applied.

- Let `entryShortTerm` be a variable ranging over all reference entries that are currently marked as "used for short-term reference". When some values of `entryShortTerm` are present having `PicOrderCnt( entryShortTerm )` greater than `PicOrderCnt( CurrPic )`, these values of `entryShortTerm` are placed at the beginning of `refFrameList1ShortTerm` in ascending order of `PicOrderCnt( entryShortTerm )`. All of the remaining values of `entryShortTerm` (when present) are then appended to `refFrameList1ShortTerm` in descending order of `PicOrderCnt( entryShortTerm )`.

NOTE - When the current field follows in decoding order a coded field `fldPrev` with which together it forms a complementary reference field pair, `fldPrev` is included into the list `refFrameList1ShortTerm` using `PicOrderCnt( fldPrev )` and the ordering method described in the previous sentence is applied.

- `refFrameListLongTerm` is ordered starting with the reference entry having the lowest `LongTermFrameIdx` value and proceeding through in ascending order to the reference entry having highest `LongTermFrameIdx` value.

NOTE - When the complementary field of the current picture is marked "used for long-term reference" it is included into the list `refFrameListLongTerm`. A reference entry in which only one field is marked as "used for long-term reference" is included into the list `refFrameListLongTerm`.

The process specified in subclause 8.2.4.2.5 is invoked with `refFrameList0ShortTerm` and `refFrameListLongTerm` given as input and the output is assigned to `RefPicList0`.

The process specified in subclause 8.2.4.2.5 is invoked with `refFrameList1ShortTerm` and `refFrameListLongTerm` given as input and the output is assigned to `RefPicList1`.

When the reference picture list `RefPicList1` has more than one entry and `RefPicList1` is identical to the reference picture list `RefPicList0`, the first two entries `RefPicList1[0]` and `RefPicList1[1]` are switched.

8.2.4.2.5 Initialisation process for reference picture lists in fields

Inputs of this process are the reference frame lists `refFrameListXShortTerm` (with `X` may be 0 or 1) and `refFrameListLongTerm`.

The reference picture list `RefPicListX` is a list ordered such that short-term reference fields have lower indices than long-term reference fields. Given the reference frame lists `refFrameListXShortTerm` and `refFrameListLongTerm`, it is derived as follows.

- Short-term reference fields are ordered by selecting reference fields from the ordered list of frames `refFrameListXShortTerm` by alternating between fields of differing parity, starting with a field that has the same parity as the current field (when present). When one field of a reference frame was not decoded or is not marked as "used for short-term reference", the missing field is ignored and instead the next available stored reference field of the chosen parity from the ordered list of frames `refFrameListXShortTerm` is inserted into `RefPicListX`. When there are no more short-term reference fields of the alternate parity in the ordered list of frames `refFrameListXShortTerm`, the next not yet indexed fields of the available parity are inserted into `RefPicListX` in the order in which they occur in the ordered list of frames `refFrameListXShortTerm`.
- Long-term reference fields are ordered by selecting reference fields from the ordered list of frames `refFrameListLongTerm` by alternating between fields of differing parity, starting with a field that has the same parity as the current field (when present). When one field of a reference frame was not decoded or is not marked as "used for long-term reference", the missing field is ignored and instead the next available stored reference field of the chosen parity from the ordered list of frames `refFrameListLongTerm` is inserted into `RefPicListX`. When there are no more long-term reference fields of the alternate parity in the ordered list of frames `refFrameListLongTerm`, the next not yet indexed fields of the available parity are inserted into `RefPicListX` in the order in which they occur in the ordered list of frames `refFrameListLongTerm`.

8.2.4.3 Reordering process for reference picture lists

When `ref_pic_list_reordering_flag_l0` is equal to 1, the following applies.

- Let `refIdxL0` be an index into the reference picture list `RefPicList0`. It is initially set equal to 0.
- The corresponding syntax elements `reordering_of_pic_nums_idc` are processed in the order they occur in the bitstream. For each of these syntax elements, the following applies.
 - If `reordering_of_pic_nums_idc` is equal to 0 or equal to 1, the process specified in subclause 8.2.4.3.1 is invoked with `refIdxL0` as input, and the output is assigned to `refIdxL0`.
 - Otherwise, if `reordering_of_pic_nums_idc` is equal to 2, the process specified in subclause 8.2.4.3.2 is invoked with `refIdxL0` as input, and the output is assigned to `refIdxL0`.
 - Otherwise (`reordering_of_pic_nums_idc` is equal to 3), the reordering process for reference picture list `RefPicList0` is finished.

When `ref_pic_list_reordering_flag_l1` is equal to 1, the following applies.

- Let `refIdxL1` be an index into the reference picture list `RefPicList1`. It is initially set equal to 0.
- The corresponding syntax elements `reordering_of_pic_nums_idc` are processed in the order they occur in the bitstream. For each of these syntax elements, the following applies.
 - If `reordering_of_pic_nums_idc` is equal to 0 or equal to 1, the process specified in subclause 8.2.4.3.1 is invoked with `refIdxL1` as input, and the output is assigned to `refIdxL1`.
 - Otherwise, if `reordering_of_pic_nums_idc` is equal to 2, the process specified in subclause 8.2.4.3.2 is invoked with `refIdxL1` as input, and the output is assigned to `refIdxL1`.
 - Otherwise (`reordering_of_pic_nums_idc` is equal to 3), the reordering process for reference picture list `RefPicList1` is finished.

8.2.4.3.1 Reordering process of reference picture lists for short-term reference pictures

Input to this process is an index `refIdxLX` (with `X` being 0 or 1).

Output of this process is an incremented index `refIdxLX`.

The variable `picNumLXNoWrap` is derived as follows.

- If `reordering_of_pic_nums_idc` is equal to 0

$$\begin{aligned} &\text{if}(\text{picNumLXPred} - (\text{abs_diff_pic_num_minus1} + 1) < 0) \\ &\quad \text{picNumLXNoWrap} = \text{picNumLXPred} - (\text{abs_diff_pic_num_minus1} + 1) + \text{MaxPicNum} \\ &\text{else} \\ &\quad \text{picNumLXNoWrap} = \text{picNumLXPred} - (\text{abs_diff_pic_num_minus1} + 1) \end{aligned} \quad (8-35)$$

- Otherwise (`reordering_of_pic_nums_idc` is equal to 1),

$$\begin{aligned} &\text{if}(\text{picNumLXPred} + (\text{abs_diff_pic_num_minus1} + 1) \geq \text{MaxPicNum}) \\ &\quad \text{picNumLXNoWrap} = \text{picNumLXPred} + (\text{abs_diff_pic_num_minus1} + 1) - \text{MaxPicNum} \\ &\text{else} \\ &\quad \text{picNumLXNoWrap} = \text{picNumLXPred} + (\text{abs_diff_pic_num_minus1} + 1) \end{aligned} \quad (8-36)$$

`picNumLXPred` is the prediction value for the variable `picNumLXNoWrap`. When the process specified in this subclause is invoked the first time for a slice (that is, for the first occurrence of `reordering_of_pic_nums_idc` equal to 0 or 1 in the `ref_pic_list_reordering( )` syntax), `picNumL0Pred` and `picNumL1Pred` are initially set equal to `CurrPicNum`. After each assignment of `picNumLXNoWrap`, the value of `picNumLXNoWrap` is assigned to `picNumLXPred`.

The variable `picNumLX` is derived as follows

$$\begin{aligned} &\text{if}(\text{picNumLXNoWrap} > \text{CurrPicNum}) \\ &\quad \text{picNumLX} = \text{picNumLXNoWrap} - \text{MaxPicNum} \\ &\text{else} \\ &\quad \text{picNumLX} = \text{picNumLXNoWrap} \end{aligned} \quad (8-37)$$

`picNumLX` shall be equal to the `PicNum` of a reference picture that is marked as “used for short-term reference” and shall not be equal to the `PicNum` of a short-term reference picture that is marked as “non-existing”.

The following procedure shall be conducted to place the picture with short-term picture number `picNumLX` into the index position `refIdxLX`, shift the position of any other remaining pictures to later in the list, and increment the value of `refIdxLX`.

```

for( cIdx = num_ref_idx_IX_active_minus1 + 1; cIdx > refIdxLX; cIdx-- )
    RefPicListX[ cIdx ] = RefPicListX[ cIdx - 1 ]
RefPicListX[ refIdxLX++ ] = short-term reference picture with PicNum equal to picNumLX
nIdx = refIdxLX
for( cIdx = refIdxLX; cIdx <= num_ref_idx_IX_active_minus1 + 1; cIdx++ )
    if( PicNumF( RefPicListX[ cIdx ] ) != picNumLX )
        RefPicListX[ nIdx++ ] = RefPicListX[ cIdx ]

```

(8-38)

where the function `PicNumF( RefPicListX[ cIdx ] )` is derived as follows:

- If the picture `RefPicListX[ cIdx ]` is marked as "used for short-term reference", `PicNumF( RefPicListX[ cIdx ] )` is the `PicNum` of the picture `RefPicListX[ cIdx ]`.
- Otherwise (the picture `RefPicListX[ cIdx ]` is not marked as "used for short-term reference"), `PicNumF( RefPicListX[ cIdx ] )` is equal to `MaxPicNum`.

NOTE – A value of `MaxPicNum` can never be equal to `picNumLX`.

NOTE – Within this pseudo-code procedure, the length of the list `RefPicListX` is temporarily made one element longer than the length needed for the final list. After the execution of this procedure, only elements 0 through `num_ref_idx_IX_active_minus1` of the list need to be retained.

8.2.4.3.2 Reordering process of reference picture lists for long-term reference pictures

Input to this process is an index `refIdxLX` (with `X` being 0 or 1).

Output of this process is an incremented index `refIdxLX`.

The following procedure shall be conducted to place the picture with long-term picture number `long_term_pic_num` into the index position `refIdxLX`, shift the position of any other remaining pictures to later in the list, and increment the value of `refIdxLX`.

```

for( cIdx = num_ref_idx_IX_active_minus1 + 1; cIdx > refIdxLX; cIdx-- )
    RefPicListX[ cIdx ] = RefPicListX[ cIdx - 1 ]
RefPicListX[ refIdxLX++ ] = long-term reference picture with LongTermPicNum equal to long_term_pic_num
nIdx = refIdxLX
for( cIdx = refIdxLX; cIdx <= num_ref_idx_IX_active_minus1 + 1; cIdx++ )
    if( LongTermPicNumF( RefPicListX[ cIdx ] ) != long_term_pic_num )
        RefPicListX[ nIdx++ ] = RefPicListX[ cIdx ]

```

(8-39)

where the function `LongTermPicNumF( RefPicListX[ cIdx ] )` is derived as follows:

- If the picture `RefPicListX[ cIdx ]` is marked as "used for long-term reference", `LongTermPicNumF( RefPicListX[ cIdx ] )` is the `LongTermPicNum` of the picture `RefPicListX[ cIdx ]`.
- Otherwise (the picture `RefPicListX[ cIdx ]` is not marked as "used for long-term reference"), `LongTermPicNumF( RefPicListX[ cIdx ] )` is equal to $2 * (\text{MaxLongTermFrameIdx} + 1)$.

NOTE – A value of $2 * (\text{MaxLongTermFrameIdx} + 1)$ can never be equal to `long_term_pic_num`.

NOTE – Within this pseudo-code procedure, the length of the list `RefPicListX` is temporarily made one element longer than the length needed for the final list. After the execution of this procedure, only elements 0 through `num_ref_idx_IX_active_minus1` of the list need to be retained.

8.2.5 Decoded reference picture marking process

This process is invoked for decoded pictures when `nal_ref_idc` is not equal to 0.

NOTE – The decoding process for gaps in `frame_num` that is specified in subclause 8.2.5.2 may also be invoked when `nal_ref_idc` is equal to 0, as specified in clause 8.

A decoded picture with `nal_ref_idc` not equal to 0, referred to as a reference picture, is marked as "used for short-term reference" or "used for long-term reference". For a decoded reference frame, both of its fields are marked the same as the frame. For a complementary reference field pair, the pair is marked the same as both of its fields. A picture that is marked as "used for short-term reference" is identified by its `FrameNum` and, when it is a field, by its parity. A picture

that is marked as "used for long-term reference" is identified by its LongTermFrameIdx and, when it is a field, by its parity.

Frames or complementary field pairs marked as "used for short-term reference" or as "used for long-term reference" can be used as a reference for inter prediction when decoding a frame until the frame, the complementary field pair, or one of its constituent fields is marked as "unused for reference". A field marked as "used for short-term reference" or as "used for long-term reference" can be used as a reference for inter prediction when decoding a field until marked as "unused for reference".

A picture can be marked as "unused for reference" by the sliding window reference picture marking process, a first-in, first-out mechanism specified in subclause 8.2.5.3 or by the adaptive memory control reference picture marking process, a customised adaptive marking operation specified in subclause 8.2.5.4.

A short-term reference picture is identified for use in the decoding process by its variables FrameNum and FrameNumWrap and its picture number PicNum, and a long-term reference picture is identified for use in the decoding process by its long-term picture number LongTermPicNum. When the current picture is not an IDR picture, subclause 8.2.4.1 is invoked to specify the assignment of the variables FrameNum, FrameNumWrap, PicNum and LongTermPicNum.

8.2.5.1 Sequence of operations for decoded reference picture marking process

Decoded reference picture marking proceeds in the following ordered steps.

1. All slices of the current picture are decoded.
2. Depending on whether the current picture is an IDR picture, the following applies.
 - If the current picture is an IDR picture, the following applies.
 - All reference pictures shall be marked as "unused for reference"
 - Depending on long_term_reference_flag, the following applies.
 - If long_term_reference_flag is equal to 0, the IDR picture shall be marked as "used for short-term reference" and MaxLongTermFrameIdx shall be set equal to "no long-term frame indices".
 - Otherwise (long_term_reference_flag is equal to 1), the IDR picture shall be marked as "used for long-term reference", the LongTermFrameIdx for the IDR picture shall be set equal to 0, and MaxLongTermFrameIdx shall be set equal to 0.
 - Otherwise (the current picture is not an IDR picture), the following applies.
 - If adaptive_ref_pic_marking_mode_flag is equal to 0, the process specified in subclause 8.2.5.3 is invoked.
 - Otherwise (adaptive_ref_pic_marking_mode_flag is equal to 1), the process specified in subclause 8.2.5.4 is invoked.
3. When the current picture is not an IDR picture and it was not marked as "used for long-term reference" by memory_management_control_operation equal to 6, it is marked as "used for short-term reference".

After marking the current decoded reference picture, the total number of frames with at least one field marked as "used for reference", plus the number of complementary field pairs with at least one field marked as "used for reference", plus the number of non-paired fields marked as "used for reference" shall not be greater than $\text{Max}(\text{num_ref_frames}, 1)$.

8.2.5.2 Decoding process for gaps in frame_num

This process is invoked when frame_num is not equal to PrevRefFrameNum and is not equal to $(\text{PrevRefFrameNum} + 1) \% \text{MaxFrameNum}$.

NOTE – Although this process is specified as a subclause within subclause 8.2.5 (which defines a process that is invoked only when nal_ref_idc is not equal to 0), this process may also be invoked when nal_ref_idc is equal to 0 (as specified in clause 8). The reasons for the location of this subclause within the structure of this Recommendation | International Standard are historical.

NOTE – This process can only be invoked for a conforming bitstream when gaps_in_frame_num_value_allowed_flag is equal to 1. When gaps_in_frame_num_value_allowed_flag is equal to 0 and frame_num is not equal to PrevRefFrameNum and is not equal to $(\text{PrevRefFrameNum} + 1) \% \text{MaxFrameNum}$, the decoding process should infer an unintentional loss of pictures.

When this process is invoked, a set of values of frame_num pertaining to "non-existing" pictures is derived as all values taken on by UnusedShortTermFrameNum in Equation 7-21 except the value of frame_num for the current picture.

The decoding process shall generate and mark a frame for each of the values of `frame_num` pertaining to “non-existing” pictures, in the order in which the values of `UnusedShortTermFrameNum` are generated by Equation 7-21, using the “sliding window” picture marking process as specified in subclause 8.2.5.3. The generated frames shall also be marked as “non-existing” and “used for short-term reference”. The sample values of the generated frames may be set to any value. These generated frames which are marked as “non-existing” shall not be referred to in the inter prediction process, shall not be referred to in the reordering commands for reference picture lists for short-term reference pictures (subclause 8.2.4.3.1), and shall not be referred to in the assignment process of a `LongTermFrameIdx` to a short-term reference picture (subclause 8.2.5.4.3).

When `pic_order_cnt_type` is not equal to 0, `TopFieldOrderCnt` and `BottomFieldOrderCnt` are derived for each of the “non-existing” frames by invoking the decoding process for picture order count in subclause 8.2.1. When invoking the process in subclause 8.2.1 for a particular “non-existing” frame, the current picture is considered to be a picture considered having `frame_num` inferred to be equal to `UnusedShortTermFrameNum`, `nal_ref_idc` inferred to be not equal to 0, `nal_unit_type` inferred to be not equal to 5, `field_pic_flag` inferred to be equal to 0, `adaptive_ref_pic_marking_mode_flag` inferred to be equal to 0, `delta_pic_order_cnt[ 0 ]` (if needed) inferred to be equal to 0, and `delta_pic_order_cnt[ 1 ]` (if needed) inferred to be equal to 0.

NOTE - The decoding process should infer an unintentional picture loss when any of these values of `frame_num` pertaining to “non-existing” pictures is referred to in the inter prediction process, is referred to in the reordering commands for reference picture lists for short-term reference pictures (subclause 8.2.4.3.1), or is referred to in the assignment process of a `LongTermFrameIdx` to a short-term reference picture (subclause 8.2.5.4.3). The decoding process should not infer an unintentional picture loss when a memory management control operation not equal to 3 is applied to a frame marked as “non-existing”.

8.2.5.3 Sliding window decoded reference picture marking process

This process is invoked when `adaptive_ref_pic_marking_mode_flag` is equal to 0.

Depending on the properties of the current picture as specified below, the following applies.

- If the current picture is a coded field that is the second field in decoding order of a complementary reference field pair, and the first field has been marked as “used for short-term reference”, the current picture is also marked as “used for short-term reference”.
- Otherwise, the following applies.
 - Let `numShortTerm` be the total number of reference frames, complementary reference field pairs and non-paired reference fields for which at least one field is marked as “used for short-term reference”. Let `numLongTerm` be the total number of reference frames, complementary reference field pairs and non-paired reference fields for which at least one field is marked as “used for long-term reference”.
 - When `numShortTerm + numLongTerm` is equal to `Max( num_ref_frames, 1 )`, the condition that `numShortTerm` is greater than 0 shall be fulfilled, and the short-term reference frame, complementary reference field pair or non-paired reference field that has the smallest value of `FrameNumWrap` is marked as “unused for reference”. When it is a frame or a complementary field pair, both of its fields are also marked as “unused for reference”.

8.2.5.4 Adaptive memory control decoded reference picture marking process

This process is invoked when `adaptive_ref_pic_marking_mode_flag` is equal to 1.

The `memory_management_control_operation` commands with values of 1 to 6 are processed in the order they occur in the bitstream after the current picture has been decoded. For each of these `memory_management_control_operation` commands, one of the processes specified in subclauses 8.2.5.4.1 to 8.2.5.4.6 is invoked depending on the value of `memory_management_control_operation`. The `memory_management_control_operation` command with value of 0 specifies the end of `memory_management_control_operation` commands.

Memory management control operations are applied to pictures as follows.

- If `field_pic_flag` is equal to 0, `memory_management_control_operation` commands are applied to the frames or complementary reference field pairs specified.
- Otherwise (`field_pic_flag` is equal to 1), `memory_management_control_operation` commands are applied to the individual reference fields specified.

8.2.5.4.1 Marking process of a short-term reference picture as “unused for reference”

This process is invoked when `memory_management_control_operation` is equal to 1.

Let `picNumX` be specified by

$$\text{picNumX} = \text{CurrPicNum} - (\text{difference_of_pic_nums_minus1} + 1). \quad (8-40)$$

Depending on `field_pic_flag` the value of `picNumX` is used to mark a short-term reference picture as “unused for reference” as follows.

- If `field_pic_flag` is equal to 0, the short-term reference frame or short-term complementary reference field pair specified by `picNumX` and both of its fields are marked as “unused for reference”.
- Otherwise (`field_pic_flag` is equal to 1), the short-term reference field specified by `picNumX` is marked as “unused for reference”. When that reference field is part of a reference frame or a complementary reference field pair, the frame or complementary field pair is also marked as “unused for reference”, but the marking of the other field is not changed.

8.2.5.4.2 Marking process of a long-term reference picture as “unused for reference”

This process is invoked when `memory_management_control_operation` is equal to 2.

Depending on `field_pic_flag` the value of `LongTermPicNum` is used to mark a long-term reference picture as “unused for reference” as follows.

- If `field_pic_flag` is equal to 0, the long-term reference frame or long-term complementary reference field pair having `LongTermPicNum` equal to `long_term_pic_num` and both of its fields are marked as “unused for reference”.
- Otherwise (`field_pic_flag` is equal to 1), the long-term reference field specified by `LongTermPicNum` equal to `long_term_pic_num` is marked as “unused for reference”. When that reference field is part of a reference frame or a complementary reference field pair, the frame or complementary field pair is also marked as “unused for reference”, but the marking of the other field is not changed.

8.2.5.4.3 Assignment process of a LongTermFrameIdx to a short-term reference picture

This process is invoked when `memory_management_control_operation` is equal to 3.

Given the syntax element `difference_of_pic_nums_minus1`, the variable `picNumX` is obtained as specified in subclause 8.2.5.4.1. `picNumX` shall refer to a frame or complementary reference field pair or non-paired reference field marked as “used for short-term reference” and not marked as “non-existing”.

When `LongTermFrameIdx` equal to `long_term_frame_idx` is already assigned to a long-term reference frame or a long-term complementary reference field pair, that frame or complementary field pair and both of its fields are marked as “unused for reference”. When `LongTermFrameIdx` is already assigned to a non-paired reference field, and the field is not the complementary field of the picture specified by `picNumX`, that field is marked as “unused for reference”.

Depending on `field_pic_flag` the value of `LongTermFrameIdx` is used to mark a picture from “used for short-term reference” to “used for long-term reference” as follows.

- If `field_pic_flag` is equal to 0, the marking of the short-term reference frame or short-term complementary reference field pair specified by `picNumX` and both of its fields are changed from “used for short-term reference” to “used for long-term reference” and assigned `LongTermFrameIdx` equal to `long_term_frame_idx`.
- Otherwise (`field_pic_flag` is equal to 1), the marking of the short-term reference field specified by `picNumX` is changed from “used for short-term reference” to “used for long-term reference” and assigned `LongTermFrameIdx` equal to `long_term_frame_idx`. When the field is part of a reference frame or a complementary reference field pair, and the other field of the same reference frame or complementary reference field pair is also marked as “used for long-term reference”, the reference frame or complementary reference field pair is also marked as “used for long-term reference” and assigned `LongTermFrameIdx` equal to `long_term_frame_idx`.

8.2.5.4.4 Decoding process for MaxLongTermFrameIdx

This process is invoked when `memory_management_control_operation` is equal to 4.

All pictures for which `LongTermFrameIdx` is greater than `max_long_term_frame_idx_plus1 - 1` and that are marked as “used for long-term reference” shall be marked as “unused for reference”.

The variable `MaxLongTermFrameIdx` is derived as follows.

- If `max_long_term_frame_idx_plus1` is equal to 0, `MaxLongTermFrameIdx` shall be set equal to “no long-term frame indices”.
- Otherwise (`max_long_term_frame_idx_plus1` is greater than 0), `MaxLongTermFrameIdx` shall be set equal to `max_long_term_frame_idx_plus1 - 1`.

NOTE – The memory_management_control_operation command equal to 4 can be used to mark long-term reference pictures as “unused for reference”. The frequency of transmitting max_long_term_frame_idx_plus1 is not specified by this Recommendation | International Standard. However, the encoder should send a memory_management_control_operation command equal to 4 upon receiving an error message, such as an intra refresh request message.

8.2.5.4.5 Marking process of all reference pictures as “unused for reference” and setting MaxLongTermFrameIdx to “no long-term frame indices”

This process is invoked when memory_management_control_operation is equal to 5.

All reference pictures are marked as “unused for reference” and the variable MaxLongTermFrameIdx is set equal to “no long-term frame indices”.

8.2.5.4.6 Process for assigning a long-term frame index to the current picture

This process is invoked when memory_management_control_operation is equal to 6.

When a variable LongTermFrameIdx equal to long_term_frame_idx is already assigned to a long-term reference frame or a long-term complementary reference field pair, that frame or complementary field pair and both of its fields are marked as “unused for reference”. When LongTermFrameIdx is already assigned to a non-paired reference field, and the field is not the complementary field of the current picture, that field is marked as “unused for reference”.

The current picture is marked as “used for long-term reference” and assigned LongTermFrameIdx equal to long_term_frame_idx.

When field_pic_flag is equal to 0, both its fields are also marked as “used for long-term reference” and assigned LongTermFrameIdx equal to long_term_frame_idx.

When field_pic_flag is equal to 1 and the current picture is the second field (in decoding order) of a complementary reference field pair, and the first field of the complementary reference field pair is also currently marked as “used for long-term reference”, the complementary reference field pair is also marked as “used for long-term reference” and assigned LongTermFrameIdx equal to long_term_frame_idx.

After marking the current decoded reference picture, the total number of frames with at least one field marked as “used for reference”, plus the number of complementary field pairs with at least one field marked as “used for reference”, plus the number of non-paired fields marked as “used for reference” shall not be greater than $\text{Max}(\text{num_ref_frames}, 1)$.

NOTE – Under some circumstances, the above statement may impose a constraint on the order in which a memory_management_control_operation syntax element equal to 6 can appear in the decoded reference picture marking syntax relative to a memory_management_control_operation syntax element equal to 1, 2, or 4.

8.3 Intra prediction process

This process is invoked for I and SI macroblock types.

Inputs to this process are constructed samples prior to the deblocking filter process and, for Intra_NxN prediction modes (where NxN is equal to 4x4 or 8x8), the values of IntraNxNPredMode from neighbouring macroblocks.

Outputs of this process are specified as follows.

- If the macroblock prediction mode is Intra_4x4 or Intra_8x8, the outputs are constructed luma samples prior to the deblocking filter process and (when chroma_format_idc is not equal to 0) chroma prediction samples of the macroblock pred_C, where C is equal to Cb and Cr.
- Otherwise, if mb_type is not equal to I_PCM, the outputs are luma prediction samples of the macroblock pred_L and (when chroma_format_idc is not equal to 0) chroma prediction samples of the macroblock pred_C, where C is equal to Cb and Cr.
- Otherwise (mb_type is equal to I_PCM), the outputs are constructed luma and (when chroma_format_idc is not equal to 0) chroma samples prior to the deblocking filter process.

The variable MvCnt is set equal to 0.

Depending on the value of mb_type the following applies.

- If mb_type is equal to I_PCM, the process specified in subclause 8.3.5 is invoked.
- Otherwise (mb_type is not equal to I_PCM), the following applies.

- The decoding processes for Intra prediction modes are described for the luma component as follows.
 - If the macroblock prediction mode is equal to Intra_4x4, the specification in subclause 8.3.1 applies.
 - Otherwise, if the macroblock prediction mode is equal to Intra_8x8, the specification in subclause 8.3.2 applies.
 - Otherwise (the macroblock prediction mode is equal to Intra_16x16), the specification in subclause 8.3.3 applies.
- The decoding processes for Intra prediction modes for the chroma components are described in subclause 8.3.4. This process shall only be invoked when chroma_format_idc is not equal to 0 (monochrome).

Samples used in the Intra prediction process shall be sample values prior to alteration by any deblocking filter operation.

8.3.1 Intra_4x4 prediction process for luma samples

This process is invoked when the macroblock prediction mode is equal to Intra_4x4.

Inputs to this process are the values of Intra4x4PredMode (if available) or Intra8x8PredMode (if available) from neighbouring macroblocks or macroblock pairs.

The luma component of a macroblock consists of 16 blocks of 4x4 luma samples. These blocks are inverse scanned using the 4x4 luma block inverse scanning process as specified in subclause 6.4.3.

For all 4x4 luma blocks of the luma component of a macroblock with luma4x4BlkIdx = 0..15, the derivation process for the Intra4x4PredMode as specified in subclause 8.3.1.1 is invoked with luma4x4BlkIdx as well as Intra4x4PredMode and Intra8x8PredMode that are previously (in decoding order) derived for adjacent macroblocks as the input and the variable Intra4x4PredMode[luma4x4BlkIdx] as the output.

For each luma block of 4x4 samples indexed using luma4x4BlkIdx = 0..15,

1. The Intra_4x4 sample prediction process in subclause 8.3.1.2 is invoked with luma4x4BlkIdx and constructed samples prior (in decoding order) to the deblocking filter process from adjacent luma blocks as the input and the output are the Intra_4x4 luma prediction samples $\text{pred}_{4x4L}[x, y]$ with $x, y = 0..3$.
2. The position of the upper-left sample of a 4x4 luma block with index luma4x4BlkIdx inside the current macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with luma4x4BlkIdx as the input and the output being assigned to (xO, yO) and $x, y = 0..3$.

$$\text{pred}_L[xO + x, yO + y] = \text{pred}_{4x4L}[x, y] \quad (8-41)$$

3. The transform coefficient decoding process and picture construction process prior to deblocking filter process in subclause 8.5 is invoked with pred_L and luma4x4BlkIdx as the input and the constructed samples for the current 4x4 luma block S'_L as the output.

8.3.1.1 Derivation process for the Intra4x4PredMode

Inputs to this process are the index of the 4x4 luma block luma4x4BlkIdx and variable arrays Intra4x4PredMode (if available) and Intra8x8PredMode (if available) that are previously (in decoding order) derived for adjacent macroblocks.

Output of this process is the variable Intra4x4PredMode[luma4x4BlkIdx].

Table 8-2 specifies the values for Intra4x4PredMode[luma4x4BlkIdx] and the associated names.

Table 8-2 – Specification of Intra4x4PredMode[luma4x4BlkIdx] and associated names

Intra4x4PredMode[luma4x4BlkIdx]	Name of Intra4x4PredMode[luma4x4BlkIdx]
0	Intra_4x4_Vertical (prediction mode)
1	Intra_4x4_Horizontal (prediction mode)
2	Intra_4x4_DC (prediction mode)
3	Intra_4x4_Diagonal_Down_Left (prediction mode)
4	Intra_4x4_Diagonal_Down_Right (prediction mode)
5	Intra_4x4_Vertical_Right (prediction mode)
6	Intra_4x4_Horizontal_Down (prediction mode)
7	Intra_4x4_Vertical_Left (prediction mode)
8	Intra_4x4_Horizontal_Up (prediction mode)

Intra4x4PredMode[luma4x4BlkIdx] labelled 0, 1, 3, 4, 5, 6, 7, and 8 represent directions of predictions as illustrated in Figure 8-1.

**Figure 8-1 – Intra_4x4 prediction mode directions (informative)**

Intra4x4PredMode[luma4x4BlkIdx] is derived as follows.

- The process specified in subclause 6.4.8.3 is invoked with luma4x4BlkIdx given as input and the output is assigned to mbAddrA, luma4x4BlkIdxA, mbAddrB, and luma4x4BlkIdxB.
- The variable dcPredModePredictedFlag is derived as follows.
 - If any of the following conditions are true, dcPredModePredictedFlag is set equal to 1
 - the macroblock with address mbAddrA is not available
 - the macroblock with address mbAddrB is not available
 - the macroblock with address mbAddrA is available and coded in Inter prediction mode and constrained_intra_pred_flag is equal to 1
 - the macroblock with address mbAddrB is available and coded in Inter prediction mode and constrained_intra_pred_flag is equal to 1
 - Otherwise, dcPredModePredictedFlag is set equal to 0.

- For N being either replaced by A or B, the variables intraMxMPredModeN are derived as follows.
 - If $\text{dcPredModePredictedFlag}$ is equal to 1 or the macroblock with address mbAddrN is not coded in Intra_4x4 or Intra_8x8 macroblock prediction mode, intraMxMPredModeN is set equal to 2 (Intra_4x4_DC prediction mode).
 - Otherwise ($\text{dcPredModePredictedFlag}$ is equal to 0 and (the macroblock with address mbAddrN is coded in Intra_4x4 macroblock prediction mode or the macroblock with address mbAddrN is coded in Intra_8x8 macroblock prediction mode)), the following applies.
 - If the macroblock with address mbAddrN is coded in Intra_4x4 macroblock mode, intraMxMPredModeN is set equal to $\text{Intra4x4PredMode}[\text{luma4x4BlkIdxN}]$, where Intra4x4PredMode is the variable array assigned to the macroblock mbAddrN .
 - Otherwise (the macroblock with address mbAddrN is coded in Intra_8x8 macroblock mode), intraMxMPredModeN is set equal to $\text{Intra8x8PredMode}[\text{luma4x4BlkIdxN} \gg 2]$, where Intra8x8PredMode is the variable array assigned to the macroblock mbAddrN .
- $\text{Intra4x4PredMode}[\text{luma4x4BlkIdx}]$ is derived by applying the following procedure.

```

predIntra4x4PredMode = Min( intraMxMPredModeA, intraMxMPredModeB )
if( prev_intra4x4_pred_mode_flag[ luma4x4BlkIdx ] )
    Intra4x4PredMode[ luma4x4BlkIdx ] = predIntra4x4PredMode
else
    if( rem_intra4x4_pred_mode[ luma4x4BlkIdx ] < predIntra4x4PredMode )
        Intra4x4PredMode[ luma4x4BlkIdx ] = rem_intra4x4_pred_mode[ luma4x4BlkIdx ]
    else
        Intra4x4PredMode[ luma4x4BlkIdx ] = rem_intra4x4_pred_mode[ luma4x4BlkIdx ] + 1
      
```

(8-42)

8.3.1.2 Intra_4x4 sample prediction

This process is invoked for each 4x4 luma block of a macroblock with prediction mode equal to Intra_4x4 followed by the transform decoding process and picture construction process prior to deblocking for each 4x4 luma block.

Input to this process is the index of a 4x4 luma block luma4x4BlkIdx .

Output of this process are the prediction samples $\text{pred4x4L}[x, y]$, with $x, y = 0..3$ for the 4x4 luma block with index luma4x4BlkIdx .

The position of the upper-left sample of a 4x4 luma block with index luma4x4BlkIdx inside the current macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with luma4x4BlkIdx as the input and the output being assigned to (xO, yO) .

The 13 neighbouring samples $p[x, y]$ that are constructed luma samples prior to the deblocking filter process, with $x = -1, y = -1..3$ and $x = 0..7, y = -1$, are derived as follows.

- The luma location (xN, yN) is specified by

$$xN = xO + x \quad (8-43)$$

$$yN = yO + y \quad (8-44)$$
- The derivation process for neighbouring locations in subclause 6.4.9 is invoked for luma locations with (xN, yN) as input and mbAddrN and (xW, yW) as output.
- Each sample $p[x, y]$ with $x = -1, y = -1..3$ and $x = 0..7, y = -1$ is derived as follows.
 - If any of the following conditions is true, the sample $p[x, y]$ is marked as “not available for Intra_4x4 prediction”
 - mbAddrN is not available,
 - the macroblock mbAddrN is coded in Inter prediction mode and $\text{constrained_intra_pred_flag}$ is equal to 1.
 - the macroblock mbAddrN has mb_type equal to SI and $\text{constrained_intra_pred_flag}$ is equal to 1 and the current macroblock does not have mb_type equal to SI.
 - x is greater than 3 and luma4x4BlkIdx is equal to 3 or 11

- Otherwise, the sample $p[x, y]$ is marked as “available for Intra_4x4 prediction” and the luma sample at luma location (xW, yW) inside the macroblock $mbAddrN$ is assigned to $p[x, y]$.

When samples $p[x, -1]$, with $x = 4..7$ are marked as “not available for Intra_4x4 prediction,” and the sample $p[3, -1]$ is marked as “available for Intra_4x4 prediction,” the sample value of $p[3, -1]$ is substituted for sample values $p[x, -1]$, with $x = 4..7$ and samples $p[x, -1]$, with $x = 4..7$ are marked as “available for Intra_4x4 prediction”.

NOTE – Each block is assumed to be constructed into a picture array prior to decoding of the next block.

Depending on $\text{Intra4x4PredMode}[\text{luma4x4BlkIdx}]$, one of the Intra_4x4 prediction modes specified in subclauses 8.3.1.2.1 to 8.3.1.2.9 shall be used.

8.3.1.2.1 Specification of Intra_4x4_Veritical prediction mode

This Intra_4x4 prediction mode shall be used when $\text{Intra4x4PredMode}[\text{luma4x4BlkIdx}]$ is equal to 0.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..3$ are marked as “available for Intra_4x4 prediction”.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = p[x, -1], \text{ with } x, y = 0..3 \quad (8-45)$$

8.3.1.2.2 Specification of Intra_4x4_Horizontal prediction mode

This Intra_4x4 prediction mode shall be used when $\text{Intra4x4PredMode}[\text{luma4x4BlkIdx}]$ is equal to 1.

This mode shall be used only when the samples $p[-1, y]$, with $y = 0..3$ are marked as “available for Intra_4x4 prediction”.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = p[-1, y], \text{ with } x, y = 0..3 \quad (8-46)$$

8.3.1.2.3 Specification of Intra_4x4_DC prediction mode

This Intra_4x4 prediction mode shall be used when $\text{Intra4x4PredMode}[\text{luma4x4BlkIdx}]$ is equal to 2.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If all samples $p[x, -1]$, with $x = 0..3$ and $p[-1, y]$, with $y = 0..3$ are marked as “available for Intra_4x4 prediction”, the values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = (p[0, -1] + p[1, -1] + p[2, -1] + p[3, -1] + p[-1, 0] + p[-1, 1] + p[-1, 2] + p[-1, 3] + 4) >> 3 \quad (8-47)$$

- Otherwise, if any samples $p[x, -1]$, with $x = 0..3$ are marked as “not available for Intra_4x4 prediction” and all samples $p[-1, y]$, with $y = 0..3$ are marked as “available for Intra_4x4 prediction”, the values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = (p[-1, 0] + p[-1, 1] + p[-1, 2] + p[-1, 3] + 2) >> 2 \quad (8-48)$$

- Otherwise, if any samples $p[-1, y]$, with $y = 0..3$ are marked as “not available for Intra_4x4 prediction” and all samples $p[x, -1]$, with $x = 0..3$ are marked as “available for Intra_4x4 prediction”, the values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = (p[0, -1] + p[1, -1] + p[2, -1] + p[3, -1] + 2) >> 2 \quad (8-49)$$

- Otherwise (some samples $p[x, -1]$, with $x = 0..3$ and some samples $p[-1, y]$, with $y = 0..3$ are marked as “not available for Intra_4x4 prediction”), the values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived by

$$\text{pred4x4}_L[x, y] = (1 << (\text{BitDepth}_Y - 1)) \quad (8-50)$$

NOTE – A 4x4 luma block can always be predicted using this mode.

8.3.1.2.4 Specification of Intra_4x4_Diagonal_Down_Left prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 3.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ are marked as “available for Intra_4x4 prediction”.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If x is equal to 3 and y is equal to 3,

$$\text{pred4x4}_L[x, y] = (p[6, -1] + 3 * p[7, -1] + 2) \gg 2 \quad (8-51)$$

- Otherwise (x is not equal to 3 or y is not equal to 3),

$$\text{pred4x4}_L[x, y] = (p[x + y, -1] + 2 * p[x + y + 1, -1] + p[x + y + 2, -1] + 2) \gg 2 \quad (8-52)$$

8.3.1.2.5 Specification of Intra_4x4_Diagonal_Down_Right prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 4.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..3$ and $p[-1, y]$ with $y = -1..3$ are marked as “available for Intra_4x4 prediction”.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If x is greater than y ,

$$\text{pred4x4}_L[x, y] = (p[x - y - 2, -1] + 2 * p[x - y - 1, -1] + p[x - y, -1] + 2) \gg 2 \quad (8-53)$$

- Otherwise if x is less than y ,

$$\text{pred4x4}_L[x, y] = (p[-1, y - x - 2] + 2 * p[-1, y - x - 1] + p[-1, y - x] + 2) \gg 2 \quad (8-54)$$

- Otherwise (x is equal to y),

$$\text{pred4x4}_L[x, y] = (p[0, -1] + 2 * p[-1, -1] + p[-1, 0] + 2) \gg 2 \quad (8-55)$$

8.3.1.2.6 Specification of Intra_4x4_Vertical_Right prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 5.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..3$ and $p[-1, y]$ with $y = -1..3$ are marked as “available for Intra_4x4 prediction”.

Let the variable zVR be set equal to $2 * x - y$.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If zVR is equal to 0, 2, 4, or 6,

$$\text{pred4x4}_L[x, y] = (p[x - (y \gg 1) - 1, -1] + p[x - (y \gg 1), -1] + 1) \gg 1 \quad (8-56)$$

- Otherwise, if zVR is equal to 1, 3, or 5,

$$\text{pred4x4}_L[x, y] = (p[x - (y \gg 1) - 2, -1] + 2 * p[x - (y \gg 1) - 1, -1] + p[x - (y \gg 1), -1] + 2) \gg 2 \quad (8-57)$$

- Otherwise, if zVR is equal to -1,

$$\text{pred4x4}_L[x, y] = (p[-1, 0] + 2 * p[-1, -1] + p[0, -1] + 2) \gg 2 \quad (8-58)$$

- Otherwise (zVR is equal to -2 or -3),

$$\text{pred4x4}_L[x, y] = (p[-1, y - 1] + 2 * p[-1, y - 2] + p[-1, y - 3] + 2) \gg 2 \quad (8-59)$$

8.3.1.2.7 Specification of Intra_4x4_Horizontal_Down prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 6.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..3$ and $p[-1, y]$ with $y = -1..3$ are marked as “available for Intra_4x4 prediction”.

Let the variable zHD be set equal to $2 * y - x$.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If zHD is equal to 0, 2, 4, or 6,

$$\text{pred4x4}_L[x, y] = (p[-1, y - (x \gg 1) - 1] + p[-1, y - (x \gg 1)] + 1) \gg 1 \quad (8-60)$$

- Otherwise, if zHD is equal to 1, 3, or 5,

$$\text{pred4x4}_L[x, y] = (p[-1, y - (x \gg 1) - 2] + 2 * p[-1, y - (x \gg 1) - 1] + p[-1, y - (x \gg 1)] + 2) \gg 2 \quad (8-61)$$

- Otherwise, if zHD is equal to -1,

$$\text{pred4x4}_L[x, y] = (p[-1, 0] + 2 * p[-1, -1] + p[0, -1] + 2) \gg 2 \quad (8-62)$$

- Otherwise (zHD is equal to -2 or -3),

$$\text{pred4x4}_L[x, y] = (p[x - 1, -1] + 2 * p[x - 2, -1] + p[x - 3, -1] + 2) \gg 2 \quad (8-63)$$

8.3.1.2.8 Specification of Intra_4x4_Vertical_Left prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 7.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ are marked as “available for Intra_4x4 prediction”.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows.

- If y is equal to 0 or 2,

$$\text{pred4x4}_L[x, y] = (p[x + (y \gg 1), -1] + p[x + (y \gg 1) + 1, -1] + 1) \gg 1 \quad (8-64)$$

- Otherwise (y is equal to 1 or 3),

$$\text{pred4x4}_L[x, y] = (p[x + (y \gg 1), -1] + 2 * p[x + (y \gg 1) + 1, -1] + p[x + (y \gg 1) + 2, -1] + 2) \gg 2 \quad (8-65)$$

8.3.1.2.9 Specification of Intra_4x4_Horizontal_Up prediction mode

This Intra_4x4 prediction mode shall be used when Intra4x4PredMode[luma4x4BlkIdx] is equal to 8.

This mode shall be used only when the samples $p[-1, y]$ with $y = 0..3$ are marked as “available for Intra_4x4 prediction”.

Let the variable zHU be set equal to $x + 2 * y$.

The values of the prediction samples $\text{pred4x4}_L[x, y]$, with $x, y = 0..3$ are derived as follows:

- If zHU is equal to 0, 2, or 4

$$\text{pred4x4}_L[x, y] = (p[-1, y + (x \gg 1)] + p[-1, y + (x \gg 1) + 1] + 1) \gg 1 \quad (8-66)$$

- Otherwise, if zHU is equal to 1 or 3

$$\text{pred4x4}_L[x, y] = (p[-1, y + (x \gg 1)] + 2 * p[-1, y + (x \gg 1) + 1] + p[-1, y + (x \gg 1) + 2] + 2) \gg 2 \quad (8-67)$$

- Otherwise, if zHU is equal to 5,

$$\text{pred4x4}_L[x, y] = (p[-1, 2] + 3 * p[-1, 3] + 2) \gg 2 \quad (8-68)$$

- Otherwise (zHU is greater than 5),

$$\text{pred4x4}_L[x, y] = p[-1, 3] \quad (8-69)$$

8.3.2 Intra_8x8 prediction process for luma samples

This process is invoked when the macroblock prediction mode is equal to Intra_8x8.

Inputs to this process are the values of Intra4x4PredMode (if available) or Intra8x8PredMode (if available) from the neighbouring macroblocks or macroblock pairs.

Outputs of this process are 8x8 luma sample arrays as part of the 16x16 luma array of prediction samples of the macroblock pred_L .

The luma component of a macroblock consists of 4 blocks of 8x8 luma samples. These blocks are inverse scanned using the inverse 8x8 luma block scanning process as specified in subclause 6.4.4.

For all 8x8 luma blocks of the luma component of a macroblock with $\text{luma8x8BlkIdx} = 0..3$, the derivation process for Intra8x8PredMode as specified in subclause 8.3.2.1 is invoked with luma8x8BlkIdx as well as Intra4x4PredMode and Intra8x8PredMode that are previously (in decoding order) derived for adjacent macroblocks as the input and the variable $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ as the output.

For the each luma block of 8x8 samples indexed using $\text{luma8x8BlkIdx} = 0..3$, the following applies.

- The Intra_8x8 sample prediction process in subclause 8.3.2.2 is invoked with luma8x8BlkIdx and constructed samples prior (in decoding order) to the deblocking filter process from adjacent luma blocks as the input and the output are the Intra_8x8 luma prediction samples $\text{pred8x8}_L[x, y]$ with $x, y = 0..7$.
- The position of the upper-left sample of an 8x8 luma block with index luma8x8BlkIdx inside the current macroblock is derived by invoking the inverse 8x8 luma block scanning process in subclause 6.4.4 with luma8x8BlkIdx as the input and the output being assigned to (xO, yO) and $x, y = 0..7$.

$$\text{pred}_L[xO + x, yO + y] = \text{pred8x8}_L[x, y] \quad (8-70)$$

- The transform coefficient decoding process and picture construction process prior to deblocking filter process in subclause 8.5 is invoked with pred_L and luma8x8BlkIdx as the input and the constructed samples for the current 8x8 luma block S'_L as the output.

8.3.2.1 Derivation process for Intra8x8PredMode

Inputs to this process are the index of the 8x8 luma block luma8x8BlkIdx and variable arrays Intra4x4PredMode (if available) and Intra8x8PredMode (if available) that are previously (in decoding order) derived for adjacent macroblocks.

Output of this process is the variable $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$.

Table 8-3 specifies the values for $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ and the associated mnemonic names.

Table 8-3 – Specification of Intra8x8PredMode[luma8x8BlkIdx] and associated names

Intra8x8PredMode[luma8x8BlkIdx]	Name of Intra8x8PredMode[luma8x8BlkIdx]
0	Intra_8x8_Vertical (prediction mode)
1	Intra_8x8_Horizontal (prediction mode)
2	Intra_8x8_DC (prediction mode)
3	Intra_8x8_Diagonal_Down_Left (prediction mode)
4	Intra_8x8_Diagonal_Down_Right (prediction mode)
5	Intra_8x8_Vertical_Right (prediction mode)
6	Intra_8x8_Horizontal_Down (prediction mode)
7	Intra_8x8_Vertical_Left (prediction mode)
8	Intra_8x8_Horizontal_Up (prediction mode)

Intra8x8PredMode[luma8x8BlkIdx] is derived as follows.

- The process specified in subclause 6.4.8.2 is invoked with luma8x8BlkIdx given as input and the output is assigned to mbAddrA, luma8x8BlkIdxA, mbAddrB, and luma8x8BlkIdxB.
- The variable dcPredModePredictedFlag is derived as follows.
 - If any of the following conditions are true, dcPredModePredictedFlag is set equal to 1
 - the macroblock with address mbAddrA is not available
 - the macroblock with address mbAddrB is not available
 - the macroblock with address mbAddrA is available and coded in Inter prediction mode and constrained_intra_pred_flag is equal to 1
 - the macroblock with address mbAddrB is available and coded in Inter prediction mode and constrained_intra_pred_flag is equal to 1
 - Otherwise, dcPredModePredictedFlag is set equal to 0.
- For N being either replaced by A or B, the variables intraMxMPredModeN are derived as follows.
 - If dcPredModePredictedFlag is equal to 1 or (the macroblock with address mbAddrN is not coded in Intra_4x4 macroblock prediction mode and the macroblock with address mbAddrN is not coded in Intra_8x8 macroblock prediction mode), intraMxMPredModeN is set equal to 2 (Intra_8x8_DC prediction mode).
 - Otherwise (dcPredModePredictedFlag is equal to 0 and (the macroblock with address mbAddrN is coded in Intra_4x4 macroblock prediction mode or the macroblock with address mbAddrN is coded in Intra_8x8 macroblock prediction mode)), the following applies.

If the macroblock with address mbAddrN is coded in Intra_8x8 macroblock mode, intraMxMPredModeN is set equal to Intra8x8PredMode[luma8x8BlkIdxN], where Intra8x8PredMode is the variable array assigned to the macroblock mbAddrN.
 - Otherwise (the macroblock with address mbAddrN is coded in Intra_4x4 macroblock mode), intraMxMPredModeN is derived by the following procedure, where Intra4x4PredMode is the variable array assigned to the macroblock mbAddrN.

$$\text{intraMxMPredModeN} = \text{Intra4x4PredMode}[\text{luma8x8BlkIdxN} * 4 + n] \quad (8-71)$$

where the variable n is derived as follows

- If N is equal to A , depending on the variable $MbaffFrameFlag$, the variable $luma8x8BlkIdx$, the current macroblock, and the macroblock $mbAddrN$, the following applies.
 - If $MbaffFrameFlag$ is equal to 1, the current macroblock is a frame coded macroblock, the macroblock $mbAddrN$ is a field coded macroblock, and $luma8x8BlkIdx$ is equal to 2, n is set equal to 3.
 - Otherwise ($MbaffFrameFlag$ is equal to 0 or the current macroblock is a field coded macroblock or the macroblock $mbAddrN$ is a frame coded macroblock or $luma8x8BlkIdx$ is not equal to 2), n is set equal to 1.
- Otherwise (N is equal to B), n is set equal to 2.
- Finally, given $intraMxMPredModeA$ and $intraMxMPredModeB$, the variable $Intra8x8PredMode[luma8x8BlkIdx]$ is derived by applying the following procedure.

```

predIntra8x8PredMode = Min( intraMxMPredModeA, intraMxMPredModeB )
if( prev_intra8x8_pred_mode_flag[ luma8x8BlkIdx ] )
    Intra8x8PredMode[ luma8x8BlkIdx ] = predIntra8x8PredMode
else
    if( rem_intra8x8_pred_mode[ luma8x8BlkIdx ] < predIntra8x8PredMode )
        Intra8x8PredMode[ luma8x8BlkIdx ] = rem_intra8x8_pred_mode[ luma8x8BlkIdx ]
    else
        Intra8x8PredMode[ luma8x8BlkIdx ] = rem_intra8x8_pred_mode[ luma8x8BlkIdx ] + 1
  
```

(8-72)

8.3.2.2 Intra_8x8 sample prediction

This process is invoked for each 8x8 luma block of a macroblock with prediction mode equal to Intra_8x8 followed by the transform decoding process and picture construction process prior to deblocking for each 8x8 luma block.

Input to this process is the index of an 8x8 luma block $luma8x8BlkIdx$.

Output of this process are the prediction samples $pred8x8_L[x, y]$, with $x, y = 0..7$ for the 8x8 luma block with index $luma8x8BlkIdx$.

The position of the upper-left sample of an 8x8 luma block with index $luma8x8BlkIdx$ inside the current macroblock is derived by invoking the inverse 8x8 luma block scanning process in subclause 6.4.4 with $luma8x8BlkIdx$ as the input and the output being assigned to (xO, yO) .

The 25 neighbouring samples $p[x, y]$ that are constructed luma samples prior to the deblocking filter process, with $x = -1, y = -1..7$ and $x = 0..15, y = -1$, are derived as follows.

- The luma location (xN, yN) is specified by

$$xN = xO + x \quad (8-73)$$

$$yN = yO + y \quad (8-74)$$

- The derivation process for neighbouring locations in subclause 6.4.9 is invoked for luma locations with (xN, yN) as input and $mbAddrN$ and (xW, yW) as output.
- Each sample $p[x, y]$ with $x = -1, y = -1..7$ and $x = 0..15, y = -1$ is derived as follows.
 - If any of the following conditions is true, the sample $p[x, y]$ is marked as “not available for Intra_8x8 prediction”
 - $mbAddrN$ is not available,
 - the macroblock $mbAddrN$ is coded in Inter prediction mode and $constrained_intra_pred_flag$ is equal to 1,
 - Otherwise, the sample $p[x, y]$ is marked as “available for Intra_8x8 prediction” and the luma sample at luma location (xW, yW) inside the macroblock $mbAddrN$ is assigned to $p[x, y]$.

When samples $p[x, -1]$, with $x = 8..15$ are marked as “not available for Intra_8x8 prediction,” and the sample $p[7, -1]$ is marked as “available for Intra_8x8 prediction,” the sample value of $p[7, -1]$ is substituted for sample values $p[x, -1]$, with $x = 8..15$ and samples $p[x, -1]$, with $x = 8..15$ are marked as “available for Intra_8x8 prediction”.

NOTE – Each block is assumed to be constructed into a picture array prior to decoding of the next block.

The reference sample filtering process for Intra_8x8 sample prediction in subclause 8.3.2.2.1 is invoked with the samples $p[x, y]$ with $x = -1, y = -1..7$ and $x = 0..15, y = -1$ (if available) as input and $p'[x, y]$ with $x = -1, y = -1..7$ and $x = 0..15, y = -1$ as output.

Depending on $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$, one of the Intra_8x8 prediction modes specified in subclauses 8.3.2.2.2 to 8.3.2.2.10 shall be used.

8.3.2.2.1 Reference sample filtering process for Intra_8x8 sample prediction

Inputs to this process are the reference samples $p[x, y]$ with $x = -1, y = -1..7$ and $x = 0..15, y = -1$ (if available) for Intra_8x8 sample prediction.

Outputs of this process are the filtered reference samples $p'[x, y]$ with $x = -1, y = -1..7$ and $x = 0..15, y = -1$ for Intra_8x8 sample prediction.

When all samples $p[x, -1]$ with $x = 0..7$ are marked as “available for Intra_8x8 prediction”, the following applies.

- The value of $p'[0, -1]$ is derived as follows.

- If $p[-1, -1]$ is marked as “available for Intra_8x8 prediction”, $p'[0, -1]$ is derived by

$$p'[0, -1] = (p[-1, -1] + 2 * p[0, -1] + p[1, -1] + 2) >> 2 \quad (8-75)$$

- Otherwise ($p[-1, -1]$ is marked as “not available for Intra_8x8 prediction”), $p'[0, -1]$ is derived by

$$p'[0, -1] = (3 * p[0, -1] + p[1, -1] + 2) >> 2 \quad (8-76)$$

- The values of $p'[x, -1]$, with $x = 1..7$ are derived by

$$p'[x, -1] = (p[x-1, -1] + 2 * p[x, -1] + p[x+1, -1] + 2) >> 2 \quad (8-77)$$

When all samples $p[x, -1]$ with $x = 7..15$ are marked as “available for Intra_8x8 prediction”, the following applies.

- The values of $p'[x, -1]$, with $x = 8..14$ are derived by

$$p'[x, -1] = (p[x-1, -1] + 2 * p[x, -1] + p[x+1, -1] + 2) >> 2 \quad (8-78)$$

- The value of $p'[15, -1]$ is derived by

$$p'[15, -1] = (p[14, -1] + 3 * p[15, -1] + 2) >> 2 \quad (8-79)$$

When the sample $p[-1, -1]$ is marked as “available for Intra_8x8 prediction”, the value of $p'[-1, -1]$ is derived as follows.

- If the sample $p[0, -1]$ is marked as “not available for Intra_8x8 prediction” or the sample $p[-1, 0]$ is marked as “not available for Intra_8x8 prediction”, the following applies.

- If the sample $p[0, -1]$ is marked as “available for Intra_8x8 prediction”, $p'[-1, -1]$ is derived by

$$p'[-1, -1] = (3 * p[-1, -1] + p[0, -1] + 2) >> 2 \quad (8-80)$$

- Otherwise (the sample $p[0, -1]$ is marked as “not available for Intra_8x8 prediction” and the sample $p[-1, 0]$ is marked as “available for Intra_8x8 prediction”), $p'[-1, -1]$ is derived by

$$p'[-1, -1] = (3 * p[-1, -1] + p[-1, 0] + 2) >> 2 \quad (8-81)$$

- Otherwise (the sample $p[0, -1]$ is marked as “available for Intra_8x8 prediction” and the sample $p[-1, 0]$ is marked as “not available for Intra_8x8 prediction”), $p'[-1, -1]$ is derived by

$$p'[-1, -1] = (p[0, -1] + 2 * p[-1, -1] + p[-1, 0] + 2) >> 2 \quad (8-82)$$

When all samples $p[-1, y]$ with $y = 0..7$ are marked as “available for Intra_8x8 prediction”, the following applies.

- The value of $p'[-1, 0]$ is derived as follows.

- If $p[-1, -1]$ is marked as “available for Intra_8x8 prediction”, $p'[-1, 0]$ is derived by

$$p'[-1, 0] = (p[-1, -1] + 2 * p[-1, 0] + p[-1, 1] + 2) >> 2 \quad (8-83)$$

- Otherwise (if $p[-1, -1]$ is marked as “not available for Intra_8x8 prediction”), $p'[-1, 0]$ is derived by

$$p'[-1, 0] = (3 * p[-1, 0] + p[-1, 1] + 2) >> 2 \quad (8-84)$$

- The values of $p'[-1, y]$, with $y = 1..6$ are derived by

$$p'[-1, y] = (p[-1, y-1] + 2 * p[-1, y] + p[-1, y+1] + 2) >> 2 \quad (8-85)$$

- The value of $p'[-1, 7]$ is derived by

$$p'[-1, 7] = (p[-1, 6] + 3 * p[-1, 7] + 2) >> 2 \quad (8-86)$$

8.3.2.2.2 Specification of Intra_8x8_Vertical prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 0.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ are marked as “available for Intra_8x8 prediction”.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = p'[x, -1], \text{ with } x, y = 0..7 \quad (8-87)$$

8.3.2.2.3 Specification of Intra_8x8_Horizontal prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 1.

This mode shall be used only when the samples $p[-1, y]$, with $y = 0..7$ are marked as “available for Intra_8x8 prediction”.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = p'[-1, y], \text{ with } x, y = 0..7 \quad (8-88)$$

8.3.2.2.4 Specification of Intra_8x8_DC prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 2.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If all samples $p[x, -1]$, with $x = 0..7$ and $p[-1, y]$, with $y = 0..7$ are marked as “available for Intra_8x8 prediction,” the values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = \left(\sum_{x'=0}^7 p'[x', -1] + \sum_{y'=0}^7 p'[-1, y'] + 8 \right) >> 4 \quad (8-89)$$

- Otherwise, if any samples $p[x, -1]$, with $x = 0..7$ are marked as “not available for Intra_8x8 prediction” and all samples $p[-1, y]$, with $y = 0..7$ are marked as “available for Intra_8x8 prediction”, the values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = \left(\sum_{y'=0}^7 p'[-1, y'] + 4 \right) >> 3 \quad (8-90)$$

- Otherwise, if any samples $p[-1, y]$, with $y = 0..7$ are marked as “not available for Intra_8x8 prediction” and all samples $p[x, -1]$, with $x = 0..7$ are marked as “available for Intra_8x8 prediction”, the values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = \left(\sum_{x'=0}^7 p'[x', -1] + 4 \right) \gg 3 \quad (8-91)$$

- Otherwise (some samples $p[x, -1]$, with $x = 0..7$ and some samples $p[-1, y]$, with $y = 0..7$ are marked as “not available for Intra_8x8 prediction”), the values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived by

$$\text{pred8x8}_L[x, y] = (1 \ll (\text{BitDepth}_Y - 1)) \quad (8-92)$$

NOTE – An 8x8 luma block can always be predicted using this mode.

8.3.2.2.5 Specification of Intra_8x8_Diagonal_Down_Left prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 3.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..15$ are marked as “available for Intra_8x8 prediction”.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If x is equal to 7 and y is equal to 7,

$$\text{pred8x8}_L[x, y] = (p'[14, -1] + 3 * p'[15, -1] + 2) \gg 2 \quad (8-93)$$

- Otherwise (x is not equal to 7 or y is not equal to 7),

$$\text{pred8x8}_L[x, y] = (p'[x + y, -1] + 2 * p'[x + y + 1, -1] + p'[x + y + 2, -1] + 2) \gg 2 \quad (8-94)$$

8.3.2.2.6 Specification of Intra_8x8_Diagonal_Down_Right prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 4.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ and $p[-1, y]$ with $y = -1..7$ are marked as “available for Intra_8x8 prediction”.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If x is greater than y ,

$$\text{pred8x8}_L[x, y] = (p'[x - y - 2, -1] + 2 * p'[x - y - 1, -1] + p'[x - y, -1] + 2) \gg 2 \quad (8-95)$$

- Otherwise if x is less than y ,

$$\text{pred8x8}_L[x, y] = (p'[-1, y - x - 2] + 2 * p'[-1, y - x - 1] + p'[-1, y - x] + 2) \gg 2 \quad (8-96)$$

- Otherwise (x is equal to y),

$$\text{pred8x8}_L[x, y] = (p'[0, -1] + 2 * p'[-1, -1] + p'[-1, 0] + 2) \gg 2 \quad (8-97)$$

8.3.2.2.7 Specification of Intra_8x8_Vertical_Right prediction mode

This Intra_8x8 prediction mode shall be used when $\text{Intra8x8PredMode}[\text{luma8x8BlkIdx}]$ is equal to 5.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ and $p[-1, y]$ with $y = -1..7$ are marked as “available for Intra_8x8 prediction”.

Let the variable zVR be set equal to $2 * x - y$.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If zVR is equal to 0, 2, 4, 6, 8, 10, 12, or 14

$$\text{pred8x8}_L[x, y] = (p'[x - (y \gg 1) - 1, -1] + p'[x - (y \gg 1), -1] + 1) \gg 1 \quad (8-98)$$

- Otherwise, if zVR is equal to 1, 3, 5, 7, 9, 11, or 13

$$\text{pred8x8}_L[x, y] = (p'[x - (y >> 1) - 2, -1] + 2 * p'[x - (y >> 1) - 1, -1] + p'[x - (y >> 1), -1] + 2) >> 2 \quad (8-99)$$

- Otherwise, if zVR is equal to -1,

$$\text{pred8x8}_L[x, y] = (p'[-1, 0] + 2 * p'[-1, -1] + p'[0, -1] + 2) >> 2 \quad (8-100)$$

- Otherwise (zVR is equal to -2, -3, -4, -5, -6, or -7),

$$\text{pred8x8}_L[x, y] = (p'[-1, y - 2 * x - 1] + 2 * p'[-1, y - 2 * x - 2] + p'[-1, y - 2 * x - 3] + 2) >> 2 \quad (8-101)$$

8.3.2.2.8 Specification of Intra_8x8_Horizontal_Down prediction mode

This Intra_8x8 prediction mode shall be used when Intra8x8PredMode[luma8x8BlkIdx] is equal to 6.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..7$ and $p[-1, y]$ with $y = -1..7$ are marked as “available for Intra_8x8 prediction”.

Let the variable zHD be set equal to $2 * y - x$.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If zHD is equal to 0, 2, 4, 6, 8, 10, 12, or 14

$$\text{pred8x8}_L[x, y] = (p'[-1, y - (x >> 1) - 1] + p'[-1, y - (x >> 1)] + 1) >> 1 \quad (8-102)$$

- Otherwise, if zHD is equal to 1, 3, 5, 7, 9, 11, or 13

$$\text{pred8x8}_L[x, y] = (p'[-1, y - (x >> 1) - 2] + 2 * p'[-1, y - (x >> 1) - 1] + p'[-1, y - (x >> 1)] + 2) >> 2 \quad (8-103)$$

- Otherwise, if zHD is equal to -1,

$$\text{pred8x8}_L[x, y] = (p'[-1, 0] + 2 * p'[-1, -1] + p'[0, -1] + 2) >> 2 \quad (8-104)$$

- Otherwise (zHD is equal to -2, -3, -4, -5, -6, -7),

$$\text{pred8x8}_L[x, y] = (p'[x - 2 * y - 1, -1] + 2 * p'[x - 2 * y - 2, -1] + p'[x - 2 * y - 3, -1] + 2) >> 2 \quad (8-105)$$

8.3.2.2.9 Specification of Intra_8x8_Vertical_Left prediction mode

This Intra_8x8 prediction mode shall be used when Intra8x8PredMode[luma8x8BlkIdx] is equal to 7.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..15$ are marked as “available for Intra_8x8 prediction”.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows.

- If y is equal to 0, 2, 4 or 6

$$\text{pred8x8}_L[x, y] = (p'[x + (y >> 1), -1] + p'[x + (y >> 1) + 1, -1] + 1) >> 1 \quad (8-106)$$

- Otherwise (y is equal to 1, 3, 5, 7),

$$\text{pred8x8}_L[x, y] = (p'[x + (y >> 1), -1] + 2 * p'[x + (y >> 1) + 1, -1] + p'[x + (y >> 1) + 2, -1] + 2) >> 2 \quad (8-107)$$

8.3.2.2.10 Specification of Intra_8x8_Horizontal_Up prediction mode

This Intra_8x8 prediction mode shall be used when Intra8x8PredMode[luma8x8BlkIdx] is equal to 8.

This mode shall be used only when the samples $p[-1, y]$ with $y = 0..7$ are marked as “available for Intra_8x8 prediction”.

Let the variable zHU be set equal to $x + 2 * y$.

The values of the prediction samples $\text{pred8x8}_L[x, y]$, with $x, y = 0..7$ are derived as follows:

- If zHU is equal to 0, 2, 4, 6, 8, 10, or 12

$$\text{pred8x8}_L[x, y] = (p'[-1, y + (x \gg 1)] + p'[-1, y + (x \gg 1) + 1] + 1) \gg 1 \quad (8-108)$$

- Otherwise, if zHU is equal to 1, 3, 5, 7, 9, or 11

$$\text{pred8x8}_L[x, y] = (p'[-1, y + (x \gg 1)] + 2 * p'[-1, y + (x \gg 1) + 1] + p'[-1, y + (x \gg 1) + 2] + 2) \gg 2 \quad (8-109)$$

- Otherwise, if zHU is equal to 13,

$$\text{pred8x8}_L[x, y] = (p'[-1, 6] + 3 * p'[-1, 7] + 2) \gg 2 \quad (8-110)$$

- Otherwise (zHU is greater than 13),

$$\text{pred8x8}_L[x, y] = p'[-1, 7] \quad (8-111)$$

8.3.3 Intra_16x16 prediction process for luma samples

This process is invoked when the macroblock prediction mode is equal to Intra_16x16. It specifies how the Intra prediction luma samples for the current macroblock are derived.

Outputs of this process are Intra prediction luma samples for the current macroblock $\text{pred}_L[x, y]$.

The 33 neighbouring samples $p[x, y]$ that are constructed luma samples prior to the deblocking filter process, with $x = -1, y = -1..15$ and with $x = 0..15, y = -1$, are derived as follows.

- The derivation process for neighbouring locations in subclause 6.4.9 is invoked for luma locations with (x, y) assigned to (xN, yN) as input and mbAddrN and (xW, yW) as output.
- Each sample $p[x, y]$ with $x = -1, y = -1..15$ and with $x = 0..15, y = -1$ is derived as follows.
 - If any of the following conditions is true, the sample $p[x, y]$ is marked as “not available for Intra_16x16 prediction”
 - mbAddrN is not available,
 - the macroblock mbAddrN is coded in Inter prediction mode and $\text{constrained_intra_pred_flag}$ is equal to 1.
 - the macroblock mbAddrN has mb_type equal to SI and $\text{constrained_intra_pred_flag}$ is equal to 1.
 - Otherwise, the sample $p[x, y]$ is marked as “available for Intra_16x16 prediction” and the luma sample at luma location (xW, yW) inside the macroblock mbAddrN is assigned to $p[x, y]$.

Let $\text{pred}_L[x, y]$ with $x, y = 0..15$ denote the prediction samples for the 16x16 luma block samples.

Intra_16x16 prediction modes are specified in Table 8-4.

Table 8-4 – Specification of Intra16x16PredMode and associated names

Intra16x16PredMode	Name of Intra16x16PredMode
0	Intra_16x16_Vertical (prediction mode)
1	Intra_16x16_Horizontal (prediction mode)
2	Intra_16x16_DC (prediction mode)
3	Intra_16x16_Plane (prediction mode)

Depending on Intra16x16PredMode, one of the Intra_16x16 prediction modes specified in subclauses 8.3.3.1 to 8.3.3.4 shall be used.

8.3.3.1 Specification of Intra_16x16_Vertical prediction mode

This Intra_16x16 prediction mode shall be used only when the samples $p[x, -1]$ with $x = 0..15$ are marked as “available for Intra_16x16 prediction”.

$$\text{pred}_L[x, y] = p[x, -1], \text{ with } x, y = 0..15 \quad (8-112)$$

8.3.3.2 Specification of Intra_16x16_Horizontal prediction mode

This Intra_16x16 prediction mode shall be used only when the samples $p[-1, y]$ with $y = 0..15$ are marked as “available for Intra_16x16 prediction”.

$$\text{pred}_L[x, y] = p[-1, y], \text{ with } x, y = 0..15 \quad (8-113)$$

8.3.3.3 Specification of Intra_16x16_DC prediction mode

This Intra_16x16 prediction mode shall be used depending on whether the neighbouring samples are marked as “available for Intra_16x16 prediction” as follows.

- If all neighbouring samples $p[x, -1]$, with $x = 0..15$ and $p[-1, y]$, with $y = 0..15$ are marked as “available for Intra_16x16 prediction”, the prediction for all luma samples in the macroblock is given by:

$$\text{pred}_L[x, y] = \left(\sum_{x'=0}^{15} p[x', -1] + \sum_{y'=0}^{15} p[-1, y'] + 16 \right) \gg 5, \text{ with } x, y = 0..15 \quad (8-114)$$

- Otherwise, if any of the neighbouring samples $p[x, -1]$, with $x = 0..15$ are marked as “not available for Intra_16x16 prediction” and all of the neighbouring samples $p[-1, y]$, with $y = 0..15$ are marked as “available for Intra_16x16 prediction”, the prediction for all luma samples in the macroblock is given by:

$$\text{pred}_L[x, y] = \left(\sum_{y'=0}^{15} p[-1, y'] + 8 \right) \gg 4, \text{ with } x, y = 0..15 \quad (8-115)$$

- Otherwise, if any of the neighbouring samples $p[-1, y]$, with $y = 0..15$ are marked as “not available for Intra_16x16 prediction” and all of the neighbouring samples $p[x, -1]$, with $x = 0..15$ are marked as “available for Intra_16x16 prediction”, the prediction for all luma samples in the macroblock is given by:

$$\text{pred}_L[x, y] = \left(\sum_{x'=0}^{15} p[x', -1] + 8 \right) \gg 4, \text{ with } x, y = 0..15 \quad (8-116)$$

- Otherwise (some of the neighbouring samples $p[x, -1]$, with $x = 0..15$ and some of the neighbouring samples $p[-1, y]$, with $y = 0..15$ are marked as “not available for Intra_16x16 prediction”), the prediction for all luma samples in the macroblock is given by:

$$\text{pred}_L[x, y] = (1 \ll (\text{BitDepth}_Y - 1)), \text{ with } x, y = 0..15 \quad (8-117)$$

8.3.3.4 Specification of Intra_16x16_Plane prediction mode

This Intra_16x16 prediction mode shall be used only when the samples $p[x, -1]$ with $x = -1..15$ and $p[-1, y]$ with $y = 0..15$ are marked as “available for Intra_16x16 prediction”.

$$\text{pred}_L[x, y] = \text{Clip}_{1Y}((a + b * (x - 7) + c * (y - 7) + 16) \gg 5), \text{ with } x, y = 0..15, \quad (8-118)$$

where:

$$a = 16 * (p[-1, 15] + p[15, -1]) \quad (8-119)$$

$$b = (5 * H + 32) \gg 6 \quad (8-120)$$

$$c = (5 * V + 32) \gg 6 \quad (8-121)$$

and H and V are specified in Equations 8-122 and 8-123.

$$H = \sum_{x'=0}^7 (x'+1) * (p[8+x', -1] - p[6-x', -1]) \quad (8-122)$$

$$V = \sum_{y'=0}^7 (y'+1) * (p[-1, 8+y'] - p[-1, 6-y']) \quad (8-123)$$

8.3.4 Intra prediction process for chroma samples

This process is invoked for I and SI macroblock types. It specifies how the Intra prediction chroma samples for the current macroblock are derived.

Outputs of this process are Intra prediction chroma samples for the current macroblock $\text{pred}_{Cb}[x, y]$ and $\text{pred}_{Cr}[x, y]$.

Both chroma blocks (Cb and Cr) of the macroblock shall use the same prediction mode. The prediction mode is applied to each of the chroma blocks separately. The process specified in this subclause is invoked for each chroma block. In the remainder of this subclause, chroma block refers to one of the two chroma blocks and the subscript C is used as a replacement of the subscript Cb or Cr.

The neighbouring samples $p[x, y]$ that are constructed chroma samples prior to the deblocking filter process, with $x = -1, y = -1 \dots \text{MbHeightC} - 1$ and with $x = 0 \dots \text{MbWidthC} - 1, y = -1$, are derived as follows.

- The derivation process for neighbouring locations in subclause 6.4.9 is invoked for chroma locations with (x, y) assigned to (xN, yN) as input and mbAddrN and (xW, yW) as output.
- Each sample $p[x, y]$ is derived as follows.
 - If any of the following conditions is true, the sample $p[x, y]$ is marked as “not available for Intra chroma prediction”
 - mbAddrN is not available,
 - the macroblock mbAddrN is coded in Inter prediction mode and $\text{constrained_intra_pred_flag}$ is equal to 1.
 - the macroblock mbAddrN has mb_type equal to SI and $\text{constrained_intra_pred_flag}$ is equal to 1 and the current macroblock does not have mb_type equal to SI.
 - Otherwise, the sample $p[x, y]$ is marked as “available for Intra chroma prediction” and the chroma sample of component C at chroma location (xW, yW) inside the macroblock mbAddrN is assigned to $p[x, y]$.

Let $\text{pred}_C[x, y]$ with $x = 0 \dots \text{MbWidthC} - 1, y = 0 \dots \text{MbHeightC} - 1$ denote the prediction samples for the chroma block samples.

Intra chroma prediction modes are specified in Table 8-5.

Table 8-5 – Specification of Intra chroma prediction modes and associated names

intra_chroma_pred_mode	Name of intra_chroma_pred_mode
0	Intra_Chroma_DC (prediction mode)
1	Intra_Chroma_Horizontal (prediction mode)
2	Intra_Chroma_Vertical (prediction mode)
3	Intra_Chroma_Plane (prediction mode)

Depending on $\text{intra_chroma_pred_mode}$, one of the Intra chroma prediction modes specified in subclauses 8.3.4.1 to 8.3.4.4 shall be used.

8.3.4.1 Specification of Intra_Chroma_DC prediction mode

This Intra chroma prediction mode shall be used when $\text{intra_chroma_pred_mode}$ is equal to 0.

For each chroma block of 4x4 samples indexed by $\text{chroma4x4BlkIdx} = 0..(1 \ll (\text{chroma_format_idc} + 1)) - 1$, the following applies.

- Depending on chroma_format_idc , the position of the upper-left sample of a 4x4 chroma block with index chroma4x4BlkIdx is derived as follows

- If chroma_format_idc is equal to 1 or 2, the following applies

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 0) \quad (8-124)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 1) \quad (8-125)$$

- Otherwise (chroma_format_idc is equal to 3), the following applies

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 0) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 0) \quad (8-126)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 1) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 1) \quad (8-127)$$

- If (xO, yO) is equal to $(0, 0)$ or xO and yO are greater than 0, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$ with $x, y = 0..3$ are derived as follows.

- If all samples $p[x + xO, -1]$, with $x = 0..3$ and $p[-1, y + yO]$, with $y = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$, with $x, y = 0..3$ are derived as

$$\text{pred}_C[x + xO, y + yO] = \left(\sum_{x'=0}^3 p[x'+xO, -1] + \sum_{y'=0}^3 p[-1, y'+yO] + 4 \right) \gg 3, \text{ with } x, y = 0..3. \quad (8-128)$$

- Otherwise, if any samples $p[x + xO, -1]$, with $x = 0..3$ are marked as “not available for Intra chroma prediction” and all samples $p[-1, y + yO]$, with $y = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$, with $x, y = 0..3$ are derived as

$$\text{pred}_C[x + xO, y + yO] = \left(\sum_{y'=0}^3 p[-1, y'+yO] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-129)$$

- Otherwise, if any samples $p[-1, y + yO]$, with $y = 0..3$ are marked as “not available for Intra chroma prediction” and all samples $p[x + xO, -1]$, with $x = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$, with $x, y = 0..3$ are derived as

$$\text{pred}_C[x + xO, y + yO] = \left(\sum_{x'=0}^3 p[x'+xO, -1] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-130)$$

- Otherwise (some samples $p[x + xO, -1]$, with $x = 0..3$ and some samples $p[-1, y + yO]$, with $y = 0..3$ are marked as “not available for Intra chroma prediction”), the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$, with $x, y = 0..3$ are derived as

$$\text{pred}_C[x + xO, y + yO] = (1 \ll (\text{BitDepth}_C - 1)), \text{ with } x, y = 0..3. \quad (8-131)$$

- Otherwise, if xO is greater than 0 and yO is equal to 0, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$ with $x, y = 0..3$ are derived as follows.

- If all samples $p[x + xO, -1]$, with $x = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $\text{pred}_C[x + xO, y + yO]$, with $x, y = 0..3$ are derived as

$$\text{pred}_C[x + xO, y + yO] = \left(\sum_{x'=0}^3 p[x'+xO, -1] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-132)$$

- Otherwise, if all samples $p[-1, y+yO]$, with $y = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $pred_C[x+xO, y+yO]$, with $x, y = 0..3$ are derived as

$$pred_C[x+xO, y+yO] = \left(\sum_{y'=0}^3 p[-1, y'+yO] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-133)$$

- Otherwise (some samples $p[x+xO, -1]$, with $x = 0..3$ and some samples $p[-1, y+yO]$, with $y = 0..3$ are marked as “not available for Intra chroma prediction”), the values of the prediction samples $pred_C[x+xO, y+yO]$, with $x, y = 0..3$ are derived as

$$pred_C[x+xO, y+yO] = (1 \ll (\text{BitDepth}_C - 1)), \text{ with } x, y = 0..3. \quad (8-134)$$

- Otherwise (xO is equal to 0 and yO is greater than 0), the values of the prediction samples $pred_C[x+xO, y+yO]$ with $x, y = 0..3$ are derived as follows.
 - If all samples $p[-1, y+yO]$, with $y = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $pred_C[x+xO, y+yO]$, with $x, y = 0..3$ are derived as

$$pred_C[x+xO, y+yO] = \left(\sum_{y'=0}^3 p[-1, y'+yO] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-135)$$

- Otherwise, if all samples $p[x+xO, -1]$, with $x = 0..3$ are marked as “available for Intra chroma prediction”, the values of the prediction samples $pred_C[x+xO, y+yO]$, with $x, y = 0..3$ are derived as

$$pred_C[x+xO, y+yO] = \left(\sum_{x'=0}^3 p[x'+xO, -1] + 2 \right) \gg 2, \text{ with } x, y = 0..3. \quad (8-136)$$

- Otherwise (some samples $p[x+xO, -1]$, with $x = 0..3$ and some samples $p[-1, y+yO]$, with $y = 0..3$ are marked as “not available for Intra chroma prediction”), the values of the prediction samples $pred_C[x+xO, y+yO]$, with $x, y = 0..3$ are derived as

$$pred_C[x+xO, y+yO] = (1 \ll (\text{BitDepth}_C - 1)), \text{ with } x, y = 0..3. \quad (8-137)$$

8.3.4.2 Specification of Intra_Chroma_Horizontal prediction mode

This Intra chroma prediction mode shall be used when `intra_chroma_pred_mode` is equal to 1.

This mode shall be used only when the samples $p[-1, y]$ with $y = 0..\text{MbHeight}_C - 1$ are marked as “available for Intra chroma prediction”.

The values of the prediction samples $pred_C[x, y]$ are derived as follows.

$$pred_C[x, y] = p[-1, y], \text{ with } x = 0..\text{MbWidth}_C - 1 \text{ and } y = 0..\text{MbHeight}_C - 1 \quad (8-138)$$

8.3.4.3 Specification of Intra_Chroma_Vertical prediction mode

This Intra chroma prediction mode shall be used when `intra_chroma_pred_mode` is equal to 2.

This mode shall be used only when the samples $p[x, -1]$ with $x = 0..\text{MbWidth}_C - 1$ are marked as “available for Intra chroma prediction”.

The values of the prediction samples $pred_C[x, y]$ are derived as follows.

$$pred_C[x, y] = p[x, -1], \text{ with } x = 0..\text{MbWidth}_C - 1 \text{ and } y = 0..\text{MbHeight}_C - 1 \quad (8-139)$$

8.3.4.4 Specification of Intra_Chroma_Plane prediction mode

This Intra chroma prediction mode shall be used when `intra_chroma_pred_mode` is equal to 3.

This mode shall be used only when the samples $p[x, -1]$, with $x = 0..\text{MbWidth}_C - 1$ and $p[-1, y]$, with $y = -1..\text{MbHeight}_C - 1$ are marked as “available for Intra chroma prediction”.

The values of the prediction samples $pred_C[x, y]$ are derived as follows.

Let the variable x_{CF} be set equal to $4 * (chroma_format_idc == 3)$ and let the variable y_{CF} be set equal to $4 * (chroma_format_idc != 1)$.

$$pred_c[x, y] = Clip1_c((a + b * (x - 3 - x_{CF}) + c * (y - 3 - y_{CF}) + 16) >> 5),$$

with $x = 0..MbWidthC - 1$ and $y = 0..MbHeightC - 1$

(8-140)

where:

$$a = 16 * (p[-1, MbHeightC - 1] + p[MbWidthC - 1, -1])$$
(8-141)

$$b = ((34 - 29 * (chroma_format_idc == 3)) * H + 32) >> 6$$
(8-142)

$$c = ((34 - 29 * (chroma_format_idc != 1)) * V + 32) >> 6$$
(8-143)

and H and V are specified as

$$H = \sum_{x'=0}^{3+x_{CF}} (x'+1) * (p[4+x_{CF}+x', -1] - p[2+x_{CF}-x', -1])$$
(8-144)

$$V = \sum_{y'=0}^{3+y_{CF}} (y'+1) * (p[-1, 4+y_{CF}+y'] - p[-1, 2+y_{CF}-y'])$$
(8-145)

8.3.5 Sample construction process for I_PCM macroblocks

This process is invoked when mb_type is equal to I_PCM .

The variable dy is derived as follows.

- If $MbaffFrameFlag$ is equal to 1 and the current macroblock is a field macroblock, dy is set equal to 2.
- Otherwise ($MbaffFrameFlag$ is equal to 0 or the current macroblock is a frame macroblock), dy is set equal to 1.

The position of the upper-left luma sample of the current macroblock is derived by invoking the inverse macroblock scanning process in subclause 6.4.1 with $CurrMbAddr$ as input and the output being assigned to (xP, yP) .

The constructed luma samples prior to the deblocking process are generated as specified by:

$$\text{for}(i = 0; i < 256; i++)$$

$$S'_L[xP + (i \% 16), yP + dy * (i / 16)] = pcm_sample_luma[i]$$
(8-146)

When $chroma_format_idc$ is not equal to 0 (monochrome), the constructed chroma samples prior to the deblocking process are generated as specified by:

$$\text{for}(i = 0; i < MbWidthC * MbHeightC; i++) \{$$

$$S'_{Cb}[(xP / SubWidthC) + (i \% MbWidthC),$$

$$(yP + SubHeightC - 1) / SubHeightC + dy * (i / MbWidthC)] =$$

$$pcm_sample_chroma[i]$$

$$S'_{Cr}[(xP / SubWidthC) + (i \% MbWidthC),$$

$$((yP + SubHeightC - 1) / SubHeightC) + dy * (i / MbWidthC)] =$$

$$pcm_sample_chroma[i + MbWidthC * MbHeightC]$$
(8-147)

8.4 Inter prediction process

This process is invoked when decoding P and B macroblock types.

Outputs of this process are Inter prediction samples for the current macroblock that are a 16×16 array $pred_L$ of luma samples and when $chroma_format_idc$ is not equal to 0 (monochrome) two 8×8 arrays $pred_{Cr}$ and $pred_{Cb}$ of chroma samples, one for each of the chroma components Cb and Cr.

The partitioning of a macroblock is specified by mb_type . Each macroblock partition is referred to by $mbPartIdx$. When the macroblock partitioning consists of partitions that are equal to sub-macroblocks, each sub-macroblock can be further partitioned into sub-macroblock partitions as specified by sub_mb_type . Each sub-macroblock partition is referred to by $subMbPartIdx$. When the macroblock partitioning does not consist of sub-macroblocks, $subMbPartIdx$ is set equal to 0.

The following steps are specified for each macroblock partition or for each sub-macroblock partition.

The functions MbPartWidth(), MbPartHeight(), SubMbPartWidth(), and SubMbPartHeight() describing the width and height of macroblock partitions and sub-macroblock partitions are specified in Table 7-13, Table 7-14, Table 7-17, and Table 7-18.

The range of the macroblock partition index mbPartIdx is derived as follows.

- If mb_type is equal to B_Skip or B_Direct_16x16, mbPartIdx proceeds over values 0..3.
- Otherwise (mb_type is not equal to B_Skip or B_Direct_16x16), mbPartIdx proceeds over values 0..NumMbPart(mb_type) – 1.

For each value of mbPartIdx, the variables partWidth and partHeight for each macroblock partition or sub-macroblock partition in the macroblock are derived as follows.

- If mb_type is not equal to P_8x8, P_8x8ref0, B_Skip, B_Direct_16x16, or B_8x8, subMbPartIdx is set equal to 0, and partWidth and partHeight are derived as

$$\text{partWidth} = \text{MbPartWidth}(\text{mb_type}) \quad (8-148)$$

$$\text{partHeight} = \text{MbPartHeight}(\text{mb_type}) \quad (8-149)$$

- Otherwise, if mb_type is equal to P_8x8 or P_8x8ref0, or mb_type is equal to B_8x8 and sub_mb_type[mbPartIdx] is not equal to B_Direct_8x8, subMbPartIdx proceeds over values 0..NumSubMbPart(sub_mb_type) – 1, and partWidth and partHeight are derived as

$$\text{partWidth} = \text{SubMbPartWidth}(\text{sub_mb_type}[\text{mbPartIdx}]) \quad (8-150)$$

$$\text{partHeight} = \text{SubMbPartHeight}(\text{sub_mb_type}[\text{mbPartIdx}]) \quad (8-151)$$

- Otherwise (mb_type is equal to B_Skip or B_Direct_16x16, or mb_type is equal to B_8x8 and sub_mb_type[mbPartIdx] is equal to B_Direct_8x8), subMbPartIdx proceeds over values 0..3, and partWidth and partHeight are derived as

$$\text{partWidth} = 4 \quad (8-152)$$

$$\text{partHeight} = 4 \quad (8-153)$$

When chroma_format_idc is not equal to 0 (monochrome) the variables partWidthC and partHeightC are derived as

$$\text{partWidthC} = \text{partWidth} / \text{SubWidthC} \quad (8-154)$$

$$\text{partHeightC} = \text{partHeight} / \text{SubHeightC} \quad (8-155)$$

Let the variable MvCnt be initially set equal to 0 before any invocation of subclause 8.4.1 for the macroblock.

The Inter prediction process for a macroblock partition mbPartIdx and a sub-macroblock partition subMbPartIdx consists of the following ordered steps

1. Derivation process for motion vector components and reference indices as specified in subclause 8.4.1.

Inputs to this process are

- a macroblock partition mbPartIdx,
- a sub-macroblock partition subMbPartIdx.

Outputs of this process are

- luma motion vectors mvL0 and mvL1 and when chroma_format_idc is not equal to 0 (monochrome) the chroma motion vectors mvCL0 and mvCL1
- reference indices refIdxL0 and refIdxL1
- prediction list utilization flags predFlagL0 and predFlagL1
- the sub-macroblock partition motion vector count subMvCnt.

2. The variable $MvCnt$ is incremented by $subMvCnt$.
3. Decoding process for Inter prediction samples as specified in subclause 8.4.2.

Inputs to this process are

- a macroblock partition $mbPartIdx$,
- a sub-macroblock partition $subMbPartIdx$.
- variables specifying partition width and height for luma and chroma (if available), $partWidth$, $partHeight$, $partWidthC$ (if available), and $partHeightC$ (if available)
- luma motion vectors $mvL0$ and $mvL1$ and when $chroma_format_idc$ is not equal to 0 (monochrome) the chroma motion vectors $mvCL0$ and $mvCL1$
- reference indices $refIdxL0$ and $refIdxL1$
- prediction list utilization flags $predFlagL0$ and $predFlagL1$

Outputs of this process are

- inter prediction samples ($pred$); which are a $(partWidth) \times (partHeight)$ array $predPart_L$ of prediction luma samples and when $chroma_format_idc$ is not equal to 0 (monochrome) two $(partWidthC) \times (partHeightC)$ arrays $predPart_{Cr}$, and $predPart_{Cb}$ of prediction chroma samples, one for each of the chroma components Cb and Cr .

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made:

$$MvL0[mbPartIdx][subMbPartIdx] = mvL0 \quad (8-156)$$

$$MvL1[mbPartIdx][subMbPartIdx] = mvL1 \quad (8-157)$$

$$RefIdxL0[mbPartIdx] = refIdxL0 \quad (8-158)$$

$$RefIdxL1[mbPartIdx] = refIdxL1 \quad (8-159)$$

$$PredFlagL0[mbPartIdx] = predFlagL0 \quad (8-160)$$

$$PredFlagL1[mbPartIdx] = predFlagL1 \quad (8-161)$$

The location of the upper-left sample of the partition relative to the upper-left sample of the macroblock is derived by invoking the inverse macroblock partition scanning process as described in subclause 6.4.2.1 with $mbPartIdx$ as the input and (xP, yP) as the output.

The location of the upper-left sample of the macroblock sub-partition relative to the upper-left sample of the macroblock partition is derived by invoking the inverse sub-macroblock partition scanning process as described in subclause 6.4.2.2 with $subMbPartIdx$ as the input and (xS, yS) as the output.

The macroblock prediction is formed by placing the partition or sub-macroblock partition prediction samples in their correct relative positions in the macroblock, as follows.

The variable $pred_L[xP + xS + x, yP + yS + y]$ with $x = 0 \dots partWidth - 1$, $y = 0 \dots partHeight - 1$ is derived by

$$pred_L[xP + xS + x, yP + yS + y] = predPart_L[x, y] \quad (8-162)$$

When $chroma_format_idc$ is not equal to 0 (monochrome) the variable $pred_C$ with $x = 0 \dots partWidthC - 1$, $y = 0 \dots partHeightC - 1$, and C in $pred_C$ and $predPart_C$ being replaced by Cb or Cr is derived by

$$pred_C[xP / SubWidthC + xS / SubWidthC + x, yP / SubHeightC + yS / SubHeightC + y] = predPart_C[x, y] \quad (8-163)$$

8.4.1 Derivation process for motion vector components and reference indices

Inputs to this process are

- a macroblock partition $mbPartIdx$,
- a sub-macroblock partition $subMbPartIdx$.

Outputs of this process are

- luma motion vectors mvL0 and mvL1 as well as the chroma motion vectors mvCL0 and mvCL1
- reference indices refIdxL0 and refIdxL1
- prediction list utilization flags predFlagL0 and predFlagL1
- a sub-partition macroblock motion vector count variable subMvCnt

For the derivation of the variables mvL0 and mvL1 as well as refIdxL0 and refIdxL1, the following applies.

- If mb_type is equal to P_Skip, the derivation process for luma motion vectors for skipped macroblocks in P and SP slices in subclause 8.4.1.1 is invoked with the output being the luma motion vectors mvL0 and reference indices refIdxL0, and predFlagL0 is set equal to 1. mvL1 and refIdxL1 are marked as not available and predFlagL1 is set equal to 0. The sub-partition motion vector count variable subMvCnt is set equal to 1.
- Otherwise, if mb_type is equal to B_Skip or B_Direct_16x16 or sub_mb_type[mbPartIdx] is equal to B_Direct_8x8, the derivation process for luma motion vectors for B_Skip, B_Direct_16x16, and B_Direct_8x8 in B slices in subclause 8.4.1.2 is invoked with mbPartIdx and subMbPartIdx as the input and the output being the luma motion vectors mvL0, mvL1, the reference indices refIdxL0, refIdxL1, the sub-partition motion vector count subMvCnt, and the prediction utilization flags predFlagL0 and predFlagL1.
- Otherwise, for X being replaced by either 0 or 1 in the variables predFlagLX, mvLX, refIdxLX, and in Pred_LX and in the syntax elements ref_idx_IX and mvd_IX, the following applies.

1. The variables refIdxLX and predFlagLX are derived as follows.

- If MbPartPredMode(mb_type, mbPartIdx) or SubMbPredMode(sub_mb_type[mbPartIdx]) is equal to Pred_LX or to BiPred,

$$\text{refIdxLX} = \text{ref_idx_IX}[\text{mbPartIdx}] \quad (8-164)$$

$$\text{predFlagLX} = 1 \quad (8-165)$$

- Otherwise, the variables refIdxLX and predFlagLX are specified by

$$\text{refIdxLX} = -1 \quad (8-166)$$

$$\text{predFlagLX} = 0 \quad (8-167)$$

2. The variable subMvCnt for sub-partition motion vector count is set equal to predFlagL0 + predFlagL1.

3. The variable currSubMbType is derived as follows.

- If the macroblock type is equal to B_8x8, currSubMbType is set equal to sub_mb_type[mbPartIdx].
- Otherwise (the macroblock type is not equal to B_8x8), currSubMbType is set equal to "na".

4. When predFlagLX is equal to 1, the derivation process for luma motion vector prediction in subclause 8.4.1.3 is invoked with mbPartIdx subMbPartIdx, refIdxLX, and currSubMbType as the inputs and the output being mvpLX. The luma motion vectors are derived by

$$\text{mvLX}[0] = \text{mvpLX}[0] + \text{mvd_IX}[\text{mbPartIdx}][\text{subMbPartIdx}][0] \quad (8-168)$$

$$\text{mvLX}[1] = \text{mvpLX}[1] + \text{mvd_IX}[\text{mbPartIdx}][\text{subMbPartIdx}][1] \quad (8-169)$$

For the derivation of the variables for the chroma motion vectors, the following applies. When predFlagLX (with X being either 0 or 1) is equal to 1, the derivation process for chroma motion vectors in subclause 8.4.1.4 is invoked with mvLX and refIdxLX as input and the output being mvCLX.

8.4.1.1 Derivation process for luma motion vectors for skipped macroblocks in P and SP slices

This process is invoked when mb_type is equal to P_Skip.

Outputs of this process are the motion vector mvL0 and the reference index refIdxL0.

The reference index refIdxL0 for a skipped macroblock is derived as follows.

$$\text{refIdxL0} = 0. \quad (8-170)$$

For the derivation of the motion vector mvL0 of a P_Skip macroblock type, the following applies.

- The process specified in subclause 8.4.1.3.2 is invoked with mbPartIdx set equal to 0, subMbPartIdx set equal to 0, currSubMbType set equal to "na", and listSuffixFlag set equal to 0 as input and the output is assigned to mbAddrA , mbAddrB , mvL0A , mvL0B , refIdxL0A , and refIdxL0B .
- The variable mvL0 is specified as follows.
 - If any of the following conditions are true, both components of the motion vector mvL0 are set equal to 0.
 - mbAddrA is not available
 - mbAddrB is not available
 - refIdxL0A is equal to 0 and both components of mvL0A are equal to 0
 - refIdxL0B is equal to 0 and both components of mvL0B are equal to 0
 - Otherwise, the derivation process for luma motion vector prediction as specified in subclause 8.4.1.3 is invoked with $\text{mbPartIdx} = 0$, $\text{subMbPartIdx} = 0$, refIdxL0 , and $\text{currSubMbType} = \text{"na"}$ as inputs and the output is assigned to mvL0 .

NOTE – The output is directly assigned to mvL0 , since the predictor is equal to the actual motion vector.

8.4.1.2 Derivation process for luma motion vectors for B_Skip , B_Direct_16x16 , and B_Direct_8x8

This process is invoked when mb_type is equal to B_Skip or B_Direct_16x16 , or $\text{sub_mb_type}[\text{mbPartIdx}]$ is equal to B_Direct_8x8 .

Inputs to this process are mbPartIdx and subMbPartIdx .

Outputs of this process are the reference indices refIdxL0 , refIdxL1 , the motion vectors mvL0 and mvL1 , the sub-partition motion vector count subMvCnt , and the prediction list utilization flags, predFlagL0 and predFlagL1 .

The derivation process depends on the value of $\text{direct_spatial_mv_pred_flag}$, which is present in the bitstream in the slice header syntax as specified in subclause 7.3.3, and is specified as follows.

- If $\text{direct_spatial_mv_pred_flag}$ is equal to 1, the mode in which the outputs of this process are derived is referred to as spatial direct prediction mode.
- Otherwise ($\text{direct_spatial_mv_pred_flag}$ is equal to 0), mode in which the outputs of this process are derived is referred to as temporal direct prediction mode.

Both spatial and temporal direct prediction mode use the co-located motion vectors and reference indices as specified in subclause 8.4.1.2.1.

The motion vectors and reference indices are derived as follows.

- If spatial direct prediction mode is used, the direct motion vector and reference index prediction mode specified in subclause 8.4.1.2.2 is used, with subMvCnt being an output.
- Otherwise (temporal direct prediction mode is used), the direct motion vector and reference index prediction mode specified in subclause 8.4.1.2.3 is used and the variable subMvCnt is derived as follows.
 - If subMbPartIdx is equal to 0, subMvCnt is set equal to 2.
 - Otherwise (subMbPartIdx is not equal to 0), subMvCnt is set equal to 0.

8.4.1.2.1 Derivation process for the co-located 4x4 sub-macroblock partitions

Inputs to this process are mbPartIdx and subMbPartIdx .

Outputs of this process are the picture colPic , the co-located macroblock mbAddrCol , the motion vector mvCol , the reference index refIdxCol , and the variable vertMvScale (which can be One_To_One , Frm_To_Fld or Fld_To_Frm).

When $\text{RefPicList1}[0]$ is a frame or a complementary field pair, let firstRefPicL1Top and $\text{firstRefPicL1Bottom}$ be the top and bottom fields of $\text{RefPicList1}[0]$, respectively, and let the following variables be specified as

$$\text{topAbsDiffPOC} = \text{Abs}(\text{DiffPicOrderCnt}(\text{firstRefPicL1Top}, \text{CurrPic})) \quad (8-171)$$

$$\text{bottomAbsDiffPOC} = \text{Abs}(\text{DiffPicOrderCnt}(\text{firstRefPicL1Bottom}, \text{CurrPic})) \quad (8-172)$$

The variable colPic specifies the picture that contains the co-located macroblock as specified in Table 8-6.

Table 8-6 – Specification of the variable colPic

field_pic_flag	RefPicList1[0] is ...	mb_field_decoding_flag	additional condition	colPic
1	a field of a decoded frame			the frame containing RefPicList1[0]
	a decoded field			RefPicList1[0]
0	a decoded frame			RefPicList1[0]
	a complementary field pair	0	topAbsDiffPOC < bottomAbsDiffPOC	firstRefPicL1Top
			topAbsDiffPOC >= bottomAbsDiffPOC	firstRefPicL1Bottom
		1	(CurrMbAddr & 1) == 0	firstRefPicL1Top
			(CurrMbAddr & 1) != 0	firstRefPicL1Bottom

When direct_8x8_inference_flag is equal to 1, subMbPartIdx is set as follows.

$$\text{subMbPartIdx} = \text{mbPartIdx} \quad (8-173)$$

Let PicCodingStruct(X) be a function with the argument X being either CurrPic or colPic. It is specified in Table 8-7.

Table 8-7 – Specification of PicCodingStruct(X)

X is coded with field_pic_flag equal to ...	mb_adaptive_frame_field_flag	PicCodingStruct(X)
1		FLD
0	0	FRM
0	1	AFRM

With luma4x4BlkIdx = mbPartIdx * 4 + subMbPartIdx, the inverse 4x4 luma block scanning process as specified in subclause 6.4.3 is invoked with luma4x4BlkIdx as the input and (x, y) assigned to (xCol, yCol) as the output.

Table 8-8 specifies the co-located macroblock address mbAddrCol, yM, and the variable vertMvScale in two steps:

1. Specification of a macroblock address mbAddrX depending on PicCodingStruct(CurrPic), and PicCodingStruct(colPic).

NOTE - It is not possible for CurrPic and colPic picture coding types to be either (FRM, AFRM) or (AFRM, FRM) because these picture coding types must be separated by an IDR picture.

2. Specification of mbAddrCol, yM, and vertMvScale depending on mb_field_decoding_flag and the variable fieldDecodingFlagX, which is derived as follows.

- If the macroblock mbAddrX in the picture colPic is a field macroblock, fieldDecodingFlagX is set equal to 1
- Otherwise (the macroblock mbAddrX in the picture colPic is a frame macroblock), fieldDecodingFlagX is set equal to 0.

Unspecified values in Table 8-8 indicate that the value of the corresponding variable is not relevant for the current table row.

mbAddrCol is set equal to CurrMbAddr or to one of the following values.

$$\text{mbAddrCol1} = 2 * \text{PicWidthInMbs} * (\text{CurrMbAddr} / \text{PicWidthInMbs}) + (\text{CurrMbAddr} \% \text{PicWidthInMbs}) + \text{PicWidthInMbs} * (\text{yCol} / 8) \quad (8-174)$$

$$\text{mbAddrCol2} = 2 * \text{CurrMbAddr} + (\text{yCol} / 8) \quad (8-175)$$

$$\text{mbAddrCol3} = 2 * \text{CurrMbAddr} + \text{bottom_field_flag} \quad (8-176)$$

$$\text{mbAddrCol4} = \text{PicWidthInMbs} * (\text{CurrMbAddr} / (2 * \text{PicWidthInMbs})) + (\text{CurrMbAddr} \% \text{PicWidthInMbs}) \quad (8-177)$$

$$\text{mbAddrCol5} = \text{CurrMbAddr} / 2 \quad (8-178)$$

$$\text{mbAddrCol6} = 2 * (\text{CurrMbAddr} / 2) + ((\text{topAbsDiffPOC} < \text{bottomAbsDiffPOC}) ? 0 : 1) \quad (8-179)$$

$$\text{mbAddrCol7} = 2 * (\text{CurrMbAddr} / 2) + (\text{yCol} / 8) \quad (8-180)$$

Table 8-8 – Specification of mbAddrCol, yM, and vertMvScale

PicCodingStruct(CurrPic)	PicCodingStruct(colPic)	mbAddrX	mb_field_decoding_flag	fieldDecodingFlagX	mbAddrCol	yM	vertMvScale
FLD	FLD				CurrMbAddr	yCol	One_To_One
	FRM				mbAddrCol1	(2 * yCol) % 16	Frm_To_Fld
	AFRM	2*CurrMbAddr	0		mbAddrCol2	(2 * yCol) % 16	Frm_To_Fld
			1		mbAddrCol3	yCol	One_To_One
FRM	FLD				mbAddrCol4	8 * ((CurrMbAddr / PicWidthInMbs) % 2) + 4 * (yCol / 8)	Fld_To_Frm
	FRM				CurrMbAddr	yCol	One_To_One
AFRM	FLD		0		mbAddrCol5	8 * (CurrMbAddr % 2) + 4 * (yCol / 8)	Fld_To_Frm
			1		mbAddrCol5	yCol	One_To_One
	AFRM	CurrMbAddr	0	0	CurrMbAddr	yCol	One_To_One
			0	1	mbAddrCol6	8 * (CurrMbAddr % 2) + 4 * (yCol / 8)	Fld_To_Frm
		CurrMbAddr	1	0	mbAddrCol7	(2 * yCol) % 16	Frm_To_Fld
			1	1	CurrMbAddr	yCol	One_To_One

Let mbPartIdxCol be the macroblock partition index of the co-located partition and subMbPartIdxCol the sub-macroblock partition index of the co-located sub-macroblock partition. The partition in the macroblock mbAddrCol inside the picture colPic covering the sample (xCol, yM) shall be assigned to mbPartIdxCol and the sub-macroblock partition inside the partition mbPartIdxCol covering the sample (xCol, yM) in the macroblock mbAddrCol inside the picture colPic shall be assigned to subMbPartIdxCol.

The prediction utilization flags `predFlagL0Col` and `predFlagL1Col` are set equal to `PredFlagL0[ mbPartIdxCol ]` and `PredFlagL1[ mbPartIdxCol ]`, respectively, which are the prediction utilization flags that have been assigned to the macroblock partition `mbAddrCol\mbPartIdxCol` inside the picture `colPic`.

The motion vector `mvCol` and the reference index `refIdxCol` are derived as follows.

- If the macroblock `mbAddrCol` is coded in Intra macroblock prediction mode or both prediction utilization flags, `predFlagL0Col` and `predFlagL1Col` are equal to 0, both components of `mvCol` are set equal to 0 and `refIdxCol` is set equal to -1.
- Otherwise, the following applies.
 - If `predFlagL0Col` is equal to 1, the motion vector `mvCol` and the reference index `refIdxCol` are set equal to `MvL0[ mbPartIdxCol ][ subMbPartIdxCol ]` and `RefIdxL0[ mbPartIdxCol ]`, respectively, which are the motion vector `mvL0` and the reference index `refIdxL0` that have been assigned to the (sub-)macroblock partition `mbAddrCol\mbPartIdxCol\subMbPartIdxCol` inside the picture `colPic`.
 - Otherwise (`predFlagL0Col` is equal to 0 and `predFlagL1Col` is equal to 1), the motion vector `mvCol` and the reference index `refIdxCol` are set equal to `MvL1[ mbPartIdxCol ][ subMbPartIdxCol ]` and `RefIdxL1[ mbPartIdxCol ]`, respectively, which are the motion vector `mvL1` and the reference index `refIdxL1` that have been assigned to the (sub-)macroblock partition `mbAddrCol\mbPartIdxCol\subMbPartIdxCol` inside the picture `colPic`.

8.4.1.2.2 Derivation process for spatial direct luma motion vector and reference index prediction mode

This process is invoked when `direct_spatial_mv_pred_flag` is equal to 1 and any of the following conditions is true.

- `mb_type` is equal to `B_Skip`
- `mb_type` is equal to `B_Direct_16x16`
- `sub_mb_type[ mbPartIdx ]` is equal to `B_Direct_8x8`.

Inputs to this process are `mbPartIdx`, `subMbPartIdx`.

Outputs of this process are the reference indices `refIdxL0`, `refIdxL1`, the motion vectors `mvL0` and `mvL1`, the sub-partition motion vector count `subMvCnt`, and the prediction list utilization flags, `predFlagL0` and `predFlagL1`.

The reference indices `refIdxL0` and `refIdxL1` and the variable `directZeroPredictionFlag` are derived by applying the following ordered steps.

1. Let the variable `currSubMbType` be set equal to `sub_mb_type[ mbPartIdx ]`.
2. The process specified in subclause 8.4.1.3.2 is invoked with `mbPartIdx = 0`, `subMbPartIdx = 0`, `currSubMbType`, and `listSuffixFlag = 0` as inputs and the output is assigned to the motion vectors `mvL0N` and the reference indices `refIdxL0N` with `N` being replaced by `A`, `B`, or `C`.
3. The process specified in subclause 8.4.1.3.2 is invoked with `mbPartIdx = 0`, `subMbPartIdx = 0`, `currSubMbType`, and `listSuffixFlag = 1` as inputs and the output is assigned to the motion vectors `mvL1N` and the reference indices `refIdxL1N` with `N` being replaced by `A`, `B`, or `C`.

NOTE – The motion vectors `mvL0N`, `mvL1N` and the reference indices `refIdxL0N`, `refIdxL1N` are identical for all 4x4 sub-macroblock partitions of a macroblock.

4. The reference indices `refIdxL0`, `refIdxL1`, and `directZeroPredictionFlag` are derived by

$$\text{refIdxL0} = \text{MinPositive}(\text{refIdxL0A}, \text{MinPositive}(\text{refIdxL0B}, \text{refIdxL0C})) \quad (8-181)$$

$$\text{refIdxL1} = \text{MinPositive}(\text{refIdxL1A}, \text{MinPositive}(\text{refIdxL1B}, \text{refIdxL1C})) \quad (8-182)$$

$$\text{directZeroPredictionFlag} = 0 \quad (8-183)$$

where

$$\text{MinPositive}(x, y) = \begin{cases} \text{Min}(x, y) & \text{if } x \geq 0 \text{ and } y \geq 0 \\ \text{Max}(x, y) & \text{otherwise} \end{cases} \quad (8-184)$$

5. When both reference indices refIdxL0 and refIdxL1 are less than 0,

$$\text{refIdxL0} = 0 \quad (8-185)$$

$$\text{refIdxL1} = 0 \quad (8-186)$$

$$\text{directZeroPredictionFlag} = 1 \quad (8-187)$$

The process specified in subclause 8.4.1.2.1 is invoked with mbPartIdx , subMbPartIdx given as input and the output is assigned to refIdxCol and mvCol .

The variable colZeroFlag is derived as follows.

- If all of the following conditions are true, colZeroFlag is set equal to 1.
 - $\text{RefPicList1}[0]$ is currently marked as "used for short-term reference".
 - refIdxCol is equal to 0
 - both motion vector components $\text{mvCol}[0]$ and $\text{mvCol}[1]$ lie in the range of -1 to 1 in units specified as follows.
 - If the colocated macroblock is a frame macroblock, the units of $\text{mvCol}[0]$ and $\text{mvCol}[1]$ are units of quarter luma frame samples.
 - Otherwise (the colocated macroblock is a field macroblock), the units of $\text{mvCol}[0]$ and $\text{mvCol}[1]$ are units of quarter luma field samples.

NOTE – For purposes of determining the condition above, the value $\text{mvCol}[1]$ is not scaled to use the units of a motion vector for the current macroblock in cases when the current macroblock is a frame macroblock and the colocated macroblock is a field macroblock or when the current macroblock is a field macroblock and the colocated macroblock is a frame macroblock. This aspect differs from the use of $\text{mvCol}[1]$ in the temporal direct mode as specified in subclause 8.4.1.2.3, which applies scaling to the motion vector of the colocated macroblock to use the same units as the units of a motion vector for the current macroblock, using Equation 8-190 or Equation 8-191 in these cases.

- Otherwise, colZeroFlag is set equal to 0.

The motion vectors mvLX (with X being 0 or 1) are derived as follows.

- If any of the following conditions is true, both components of the motion vector mvLX are set equal to 0.
 - $\text{directZeroPredictionFlag}$ is equal to 1
 - refIdxLX is less than 0
 - refIdxLX is equal to 0 and colZeroFlag is equal to 1
- Otherwise, the process specified in subclause 8.4.1.3 is invoked with $\text{mbPartIdx} = 0$, $\text{subMbPartIdx} = 0$, refIdxLX , and currSubMbType as inputs and the output is assigned to mvLX .

NOTE – The motion vector mvLX returned from subclause 8.4.1.3 is identical for all 4x4 sub-macroblock partitions of a macroblock for which the process is invoked.

The prediction utilization flags predFlagL0 and predFlagL1 shall be derived as specified using Table 8-9.

Table 8-9 – Assignment of prediction utilization flags

refIdxL0	refIdxL1	predFlagL0	predFlagL1
≥ 0	≥ 0	1	1
≥ 0	< 0	1	0
< 0	≥ 0	0	1

The variable subMvCnt is derived as follows.

- If subMbPartIdx is not equal to 0 or $\text{direct_8x8_inference_flag}$ is equal to 0, subMvCnt is set equal to 0.
- Otherwise (subMbPartIdx is equal to 0 and $\text{direct_8x8_inference_flag}$ is equal to 1), subMvCnt is set equal to $\text{predFlagL0} + \text{predFlagL1}$.

8.4.1.2.3 Derivation process for temporal direct luma motion vector and reference index prediction mode

This process is invoked when `direct_spatial_mv_pred_flag` is equal to 0 and any of the following conditions is true.

- `mb_type` is equal to `B_Skip`
- `mb_type` is equal to `B_Direct_16x16`
- `sub_mb_type[ mbPartIdx ]` is equal to `B_Direct_8x8`.

Inputs to this process are `mbPartIdx` and `subMbPartIdx`.

Outputs of this process are the motion vectors `mvL0` and `mvL1`, the reference indices `refIdxL0` and `refIdxL1`, and the prediction list utilization flags, `predFlagL0` and `predFlagL1`.

The process specified in subclause 8.4.1.2.1 is invoked with `mbPartIdx`, `subMbPartIdx` given as input and the output is assigned to `colPic`, `mbAddrCol`, `mvCol`, `refIdxCol`, and `vertMvScale`.

The reference indices `refIdxL0` and `refIdxL1` are derived as follows.

$$\text{refIdxL0} = ((\text{refIdxCol} < 0) ? 0 : \text{MapColToList0}(\text{refIdxCol})) \quad (8-188)$$

$$\text{refIdxL1} = 0 \quad (8-189)$$

NOTE - If the current macroblock is a field macroblock, `refIdxL0` and `refIdxL1` index a list of fields; otherwise (the current macroblock is a frame macroblock), `refIdxL0` and `refIdxL1` index a list of frames or complementary reference field pairs.

Let `refPicCol` be a frame, a field, or a complementary field pair that was referred by the reference index `refIdxCol` when decoding the co-located macroblock `mbAddrCol` inside the picture `colPic`. The function `MapColToList0( refIdxCol )` is specified as follows.

- If `vertMvScale` is equal to `One_To_One`, the following applies.
 - If `field_pic_flag` is equal to 0 and the current macroblock is a field macroblock, the following applies.
 - Let `refIdxL0Frm` be the lowest valued reference index in the current reference picture list `RefPicList0` that references the frame or complementary field pair that contains the field `refPicCol`. `RefPicList0` shall contain a frame or complementary field pair that contains the field `refPicCol`. The return value of `MapColToList0( )` is specified as follows.
 - If the field referred to by `refIdxCol` has the same parity as the current macroblock, `MapColToList0( refIdxCol )` returns the reference index $(\text{refIdxL0Frm} \ll 1)$.
 - Otherwise (the field referred by `refIdxCol` has the opposite parity of the current macroblock), `MapColToList0( refIdxCol )` returns the reference index $((\text{refIdxL0Frm} \ll 1) + 1)$.
 - Otherwise (`field_pic_flag` is equal to 1 or the current macroblock is a frame macroblock), `MapColToList0( refIdxCol )` returns the lowest valued reference index `refIdxL0` in the current reference picture list `RefPicList0` that references `refPicCol`. `RefPicList0` shall contain `refPicCol`.
 - Otherwise, if `vertMvScale` is equal to `Frm_To_Fld`, the following applies.
 - If `field_pic_flag` is equal to 0, let `refIdxL0Frm` be the lowest valued reference index in the current reference picture list `RefPicList0` that references `refPicCol`. `MapColToList0( refIdxCol )` returns the reference index $(\text{refIdxL0Frm} \ll 1)$. `RefPicList0` shall contain `refPicCol`.
 - Otherwise (`field_pic_flag` is equal to 1), `MapColToList0( refIdxCol )` returns the lowest valued reference index `refIdxL0` in the current reference picture list `RefPicList0` that references the field of `refPicCol` with the same parity as the current picture `CurrPic`. `RefPicList0` shall contain the field of `refPicCol` with the same parity as the current picture `CurrPic`.
 - Otherwise (`vertMvScale` is equal to `Fld_To_Frm`), `MapColToList0( refIdxCol )` returns the lowest valued reference index `refIdxL0` in the current reference picture list `RefPicList0` that references the frame or complementary field pair that contains `refPicCol`. `RefPicList0` shall contain a frame or complementary field pair that contains the field `refPicCol`.

NOTE – A decoded reference picture that was marked as "used for short-term reference" when it was referenced in the decoding process of the picture containing the co-located macroblock may have been modified to be marked as "used for long-term reference" before being used for reference for inter prediction using the direct prediction mode for the current macroblock.

Depending on the value of `vertMvScale` the vertical component of `mvCol` is modified as follows.

- If `vertMvScale` is equal to `Frm_To_Fld`

$$mvCol[1] = mvCol[1] / 2 \quad (8-190)$$

- Otherwise, if `vertMvScale` is equal to `Fld_To_Frm`

$$mvCol[1] = mvCol[1] * 2 \quad (8-191)$$

- Otherwise (`vertMvScale` is equal to `One_To_One`), `mvCol[1]` remains unchanged.

The variables `currPicOrField`, `pic0`, and `pic1`, are derived as follows.

- If `field_pic_flag` is equal to 0 and the current macroblock is a field macroblock, the following applies.
 - `currPicOrField` is the field of the current picture `CurrPic` that has the same parity as the current macroblock.
 - `pic1` is the field of `RefPicList1[0]` that has the same parity as the current macroblock.
 - The variable `pic0` is derived as follows.
 - If `refIdxL0 % 2` is equal to 0, `pic0` is the field of `RefPicList0[refIdxL0 / 2]` that has the same parity as the current macroblock.
 - Otherwise (`refIdxL0 % 2` is not equal to 0), `pic0` is the field of `RefPicList0[refIdxL0 / 2]` that has the opposite parity of the current macroblock.
- Otherwise (`field_pic_flag` is equal to 1 or the current macroblock is a frame macroblock), `currPicOrField` is the current picture `CurrPic`, `pic1` is the decoded reference picture `RefPicList1[0]`, and `pic0` is the decoded reference picture `RefPicList0[refIdxL0]`.

The two motion vectors `mvL0` and `mvL1` for each 4x4 sub-macroblock partition of the current macroblock are derived as follows:

NOTE – It is often the case that many of the 4x4 sub-macroblock partitions share the same motion vectors and reference pictures. In these cases, temporal direct mode motion compensation can calculate the inter prediction sample values in larger units than 4x4 luma sample blocks. For example, when `direct_8x8_inference_flag` is equal to 1, at least each 8x8 luma sample quadrant of the macroblock shares the same motion vectors and reference pictures.

- If the reference index `refIdxL0` refers to a long-term reference picture, or `DiffPicOrderCnt(pic1, pic0)` is equal to 0, the motion vectors `mvL0`, `mvL1` for the direct mode partition are derived by

$$mvL0 = mvCol \quad (8-192)$$

$$mvL1 = 0 \quad (8-193)$$

- Otherwise, the motion vectors `mvL0`, `mvL1` are derived as scaled versions of the motion vector `mvCol` of the co-located sub-macroblock partition as specified below (see Figure 8-2)

$$tx = (16384 + Abs(td / 2)) / td \quad (8-194)$$

$$DistScaleFactor = Clip3(-1024, 1023, (tb * tx + 32) >> 6) \quad (8-195)$$

$$mvL0 = (DistScaleFactor * mvCol + 128) >> 8 \quad (8-196)$$

$$mvL1 = mvL0 - mvCol \quad (8-197)$$

where `tb` and `td` are derived as follows.

$$tb = Clip3(-128, 127, DiffPicOrderCnt(currPicOrField, pic0)) \quad (8-198)$$

$$td = Clip3(-128, 127, DiffPicOrderCnt(pic1, pic0)) \quad (8-199)$$

NOTE - `mvL0` and `mvL1` cannot exceed the ranges specified in Annex A.

The prediction utilization flags `predFlagL0` and `predFlagL1` are both set equal to 1.

Figure 8-2 illustrates the temporal direct-mode motion vector inference when the current picture is temporally between the reference picture from reference picture list 0 and the reference picture from reference picture list 1.

Figure 8-2 –Example for temporal direct-mode motion vector inference (informative)

8.4.1.3 Derivation process for luma motion vector prediction

Inputs to this process are

- the macroblock partition index $mbPartIdx$,
- the sub-macroblock partition index $subMbPartIdx$,
- the reference index of the current partition $refIdxLX$ (with X being 0 or 1),
- the variable $currSubMbType$.

Output of this process is the prediction $mvpLX$ of the motion vector $mvLX$ (with X being 0 or 1).

The derivation process for the neighbouring blocks for motion data in subclause 8.4.1.3.2 is invoked with $mbPartIdx$, $subMbPartIdx$, $currSubMbType$, and $listSuffixFlag = X$ (with X being 0 or 1 for $refIdxLX$ being $refIdxL0$ or $refIdxL1$, respectively) as the input and with $mbAddrN\mbPartIdxN\subMbPartIdxN$, reference indices $refIdxLXN$ and the motion vectors $mvLXN$ with N being replaced by A, B, or C as the output.

The derivation process for median luma motion vector prediction in subclause 8.4.1.3.1 is invoked with $mbAddrN\mbPartIdxN\subMbPartIdxN$, $mvLXN$, $refIdxLXN$ with N being replaced by A, B, or C and $refIdxLX$ as the input and $mvpLX$ as the output, unless one of the following is true.

- $MbPartWidth(mb_type)$ is equal to 16, $MbPartHeight(mb_type)$ is equal to 8, $mbPartIdx$ is equal to 0, and $refIdxLXB$ is equal to $refIdxLX$,

$$mvpLX = mvLXB \quad (8-200)$$

- $MbPartWidth(mb_type)$ is equal to 16, $MbPartHeight(mb_type)$ is equal to 8, $mbPartIdx$ is equal to 1, and $refIdxLXA$ is equal to $refIdxLX$,

$$mvpLX = mvLXA \quad (8-201)$$

- $MbPartWidth(mb_type)$ is equal to 8, $MbPartHeight(mb_type)$ is equal to 16, $mbPartIdx$ is equal to 0, and $refIdxLXA$ is equal to $refIdxLX$,

$$mvpLX = mvLXA \quad (8-202)$$

- $MbPartWidth(mb_type)$ is equal to 8, $MbPartHeight(mb_type)$ is equal to 16, $mbPartIdx$ is equal to 1, and $refIdxLXC$ is equal to $refIdxLX$,

$$mvpLX = mvLXC \quad (8-203)$$

Figure 8-3 illustrates the non-median prediction as described above.

Figure 8-3 – Directional segmentation prediction (informative)

8.4.1.3.1 Derivation process for median luma motion vector prediction

Inputs to this process are

- the neighbouring partitions $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ (with N being replaced by A, B, or C),
- the motion vectors $mvLXN$ (with N being replaced by A, B, or C) of the neighbouring partitions,
- the reference indices $refIdxLXN$ (with N being replaced by A, B, or C) of the neighbouring partitions, and
- the reference index $refIdxLX$ of the current partition.

Output of this process is the motion vector prediction $mvpLX$.

The variable $mvpLX$ is derived as follows:

- When both partitions $mbAddrB\backslash mbPartIdxB\backslash subMbPartIdxB$ and $mbAddrC\backslash mbPartIdxC\backslash subMbPartIdxC$ are not available and $mbAddrA\backslash mbPartIdxA\backslash subMbPartIdxA$ is available,

$$mvLXB = mvLXA \quad (8-204)$$

$$mvLXC = mvLXA \quad (8-205)$$

$$refIdxLXB = refIdxLXA \quad (8-206)$$

$$refIdxLXC = refIdxLXA \quad (8-207)$$

- Depending on reference indices $refIdxLXA$, $refIdxLXB$, or $refIdxLXC$, the following applies.
 - If one and only one of the reference indices $refIdxLXA$, $refIdxLXB$, or $refIdxLXC$ is equal to the reference index $refIdxLX$ of the current partition, the following applies. Let $refIdxLXN$ be the reference index that is equal to $refIdxLX$, the motion vector $mvLXN$ is assigned to the motion vector prediction $mvpLX$:

$$mvpLX = mvLXN \quad (8-208)$$

- Otherwise, each component of the motion vector prediction $mvpLX$ is given by the median of the corresponding vector components of the motion vector $mvLXA$, $mvLXB$, and $mvLXC$:

$$mvpLX[0] = \text{Median}(mvLXA[0], mvLXB[0], mvLXC[0]) \quad (8-209)$$

$$mvpLX[1] = \text{Median}(mvLXA[1], mvLXB[1], mvLXC[1]) \quad (8-210)$$

8.4.1.3.2 Derivation process for motion data of neighbouring partitions

Inputs to this process are

- the macroblock partition index $mbPartIdx$,
- the sub-macroblock partition index $subMbPartIdx$,
- the current sub-macroblock type $currSubMbType$,
- the list suffix flag $listSuffixFlag$

Outputs of this process are (with N being replaced by A, B, or C)

- $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ specifying neighbouring partitions,
- the motion vectors $mvLXN$ of the neighbouring partitions, and
- the reference indices $refIdxLXN$ of the neighbouring partitions.

Variable names that include the string "LX" are interpreted with the X being equal to $listSuffixFlag$.

The partitions $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ with N being either A, B, or C are derived in the following ordered steps.

1. Let $mbAddrD\backslash mbPartIdxD\backslash subMbPartIdxD$ be variables specifying an additional neighbouring partition.
2. The process in subclause 6.4.8.5 is invoked with $mbPartIdx$, $currSubMbType$, and $subMbPartIdx$ as input and the output is assigned to $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ with N being replaced by A, B, C, or D.
3. When the partition $mbAddrC\backslash mbPartIdxC\backslash subMbPartIdxC$ is not available, the following applies

$$mbAddrC = mbAddrD \quad (8-211)$$

$$mbPartIdxC = mbPartIdxD \quad (8-212)$$

$$subMbPartIdxC = subMbPartIdxD \quad (8-213)$$

The motion vectors $mvLXN$ and reference indices $refIdxLXN$ (with N being A, B, or C) are derived as follows.

- If the macroblock partition or sub-macroblock partition $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ is not available or $mbAddrN$ is coded in Intra prediction mode or $predFlagLX$ of $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$ is equal to 0, both components of $mvLXN$ are set equal to 0 and $refIdxLXN$ is set equal to -1.
- Otherwise, the following applies.

- The motion vector $mvLXN$ and reference index $refIdxLXN$ are set equal to $MvLX[mbPartIdxN][subMbPartIdxN]$ and $RefIdxLX[mbPartIdxN]$, respectively, which are the motion vector $mvLX$ and reference index $refIdxLX$ that have been assigned to the (sub-)macroblock partition $mbAddrN\backslash mbPartIdxN\backslash subMbPartIdxN$.

- The variables $mvLXN[1]$ and $refIdxLXN$ are further processed as follows.

- If the current macroblock is a field macroblock and the macroblock $mbAddrN$ is a frame macroblock

$$mvLXN[1] = mvLXN[1] / 2 \quad (8-214)$$

$$refIdxLXN = refIdxLXN * 2 \quad (8-215)$$

- Otherwise, if the current macroblock is a frame macroblock and the macroblock $mbAddrN$ is a field macroblock

$$mvLXN[1] = mvLXN[1] * 2 \quad (8-216)$$

$$refIdxLXN = refIdxLXN / 2 \quad (8-217)$$

- Otherwise, the vertical motion vector component $mvLXN[1]$ and the reference index $refIdxLXN$ remain unchanged.

8.4.1.4 Derivation process for chroma motion vectors

This process shall only be invoked when chroma_format_idc is not equal to 0 (monochrome).

Inputs to this process are a luma motion vector mvLX and a reference index refIdxLX.

Output of this process is a chroma motion vector mvCLX.

A chroma motion vector is derived from the corresponding luma motion vector.

The precision of the chroma motion vector components is $1 \div (4 * \text{SubWidthC})$ horizontally and $1 \div (4 * \text{SubHeightC})$ vertically.

NOTE - For example, when using the 4:2:0 chroma format, since the units of luma motion vectors are one-quarter luma sample units and chroma has half horizontal and vertical resolution compared to luma, the units of chroma motion vectors are one-eighth chroma sample units, i.e., a value of 1 for the chroma motion vector refers to a one-eighth chroma sample displacement. For example, when the luma vector applies to 8x16 luma samples, the corresponding chroma vector in 4:2:0 chroma format applies to 4x8 chroma samples and when the luma vector applies to 4x4 luma samples, the corresponding chroma vector in 4:2:0 chroma format applies to 2x2 chroma samples.

For the derivation of the motion vector mvCLX, the following applies.

- If chroma_format_idc is not equal to 1 or the current macroblock is a frame macroblock, the horizontal and vertical components of the chroma motion vector mvCLX are derived as

$$\text{mvCLX}[0] = \text{mvLX}[0] \quad (8-218)$$

$$\text{mvCLX}[1] = \text{mvLX}[1] \quad (8-219)$$

- Otherwise (chroma_format_idc is equal to 1 and the current macroblock is a field macroblock), only the horizontal component of the chroma motion vector mvCLX[0] is derived using Equation 8-218. The vertical component of the chroma motion vector mvCLX[1] is dependent on the parity of the current field or the current macroblock and the reference picture, which is referred by the reference index refIdxLX. mvCLX[1] is derived from mvLX[1] according to Table 8-10.

Table 8-10 – Derivation of the vertical component of the chroma vector in field coding mode

Parity conditions		mvCLX[1]
Reference picture (refIdxLX)	Current field (picture/macroblock)	
Top field	Bottom field	mvLX[1] + 2
Bottom field	Top field	mvLX[1] - 2
Otherwise		mvLX[1]

8.4.2 Decoding process for Inter prediction samples

Inputs to this process are

- a macroblock partition mbPartIdx,
- a sub-macroblock partition subMbPartIdx.
- variables specifying partition width and height for luma and chroma (if available), partWidth, partHeight, partWidthC (if available) and partHeightC (if available)
- luma motion vectors mvL0 and mvL1 and when chroma_format_idc is not equal to 0 (monochrome) chroma motion vectors mvCL0 and mvCL1
- reference indices refIdxL0 and refIdxL1
- prediction list utilization flags, predFlagL0 and predFlagL1

Outputs of this process are

- the Inter prediction samples predPart , which are a $(\text{partWidth}) \times (\text{partHeight})$ array predPart_L of prediction luma samples, and when chroma_format_idc is not equal to 0 (monochrome) two $(\text{partWidthC}) \times (\text{partHeightC})$ arrays predPart_{Cb} , predPart_{Cr} of prediction chroma samples, one for each of the chroma components Cb and Cr.

Let predPartL0_L and predPartL1_L be $(\text{partWidth}) \times (\text{partHeight})$ arrays of predicted luma sample values and when chroma_format_idc is not equal to 0 (monochrome) predPartL0_{Cb} , predPartL1_{Cb} , predPartL0_{Cr} , and predPartL1_{Cr} be $(\text{partWidthC}) \times (\text{partHeightC})$ arrays of predicted chroma sample values.

For LX being replaced by either L0 or L1 in the variables predFlagLX , RefPicListX , refIdxLX , refPicLX , predPartLX , the following is specified.

When predFlagLX is equal to 1, the following applies.

- The reference picture consisting of an ordered two-dimensional array refPicLX_L of luma samples and when chroma_format_idc is not equal to 0 (monochrome) two ordered two-dimensional arrays refPicLX_{Cb} and refPicLX_{Cr} of chroma samples is derived by invoking the process specified in subclause 8.4.2.1 with refIdxLX and RefPicListX given as input.
- The array predPartLX_L and when chroma_format_idc is not equal to 0 (monochrome) the arrays predPartLX_{Cb} and predPartLX_{Cr} are derived by invoking the process specified in subclause 8.4.2.2 with the current partition specified by mbPartIdx and subMbPartIdx , the motion vectors mvLX , mvCLX (if available), and the reference arrays with refPicLX_L , refPicLX_{Cb} (if available), and refPicLX_{Cr} (if available) given as input.

For C being replaced by L, Cb (if available), or Cr (if available), the array predPart_C of the prediction samples of component C is derived by invoking the process specified in subclause 8.4.2.3 with the current partition specified by mbPartIdx and subMbPartIdx and the array predPartL0_C and predPartL1_C as well as predFlagL0 and predFlagL1 given as input.

8.4.2.1 Reference picture selection process

Input to this process is a reference index refIdxLX .

Output of this process is a reference picture consisting of a two-dimensional array of luma samples refPicLX_L and two two-dimensional arrays of chroma samples refPicLX_{Cb} and refPicLX_{Cr} .

Depending on field_pic_flag , the reference picture list RefPicListX (which has been derived as specified in subclause 8.2.4) consists of the following.

- If field_pic_flag is equal to 1, each entry of RefPicListX is a reference field or a field of a reference frame.
- Otherwise (field_pic_flag is equal to 0), each entry of RefPicListX is a reference frame or a complementary reference field pair.

For the derivation of the reference picture, the following applies.

- If field_pic_flag is equal to 1, the reference field or field of a reference frame $\text{RefPicListX}[\text{refIdxLX}]$ is the output. The output reference field or field of a reference frame consists of a $(\text{PicWidthInSamples}_L) \times (\text{PicHeightInSamples}_L)$ array of luma samples refPicLX_L and, when chroma_format_idc is not equal to 0 (monochrome), two $(\text{PicWidthInSamples}_C) \times (\text{PicHeightInSamples}_C)$ arrays of chroma samples refPicLX_{Cb} and refPicLX_{Cr} .
- Otherwise (field_pic_flag is equal to 0), the following applies.
 - If the current macroblock is a frame macroblock, the reference frame or complementary reference field pair $\text{RefPicListX}[\text{refIdxLX}]$ is the output. The output reference frame or complementary reference field pair consists of a $(\text{PicWidthInSamples}_L) \times (\text{PicHeightInSamples}_L)$ array of luma samples refPicLX_L and, when chroma_format_idc is not equal to 0 (monochrome), two $(\text{PicWidthInSamples}_C) \times (\text{PicHeightInSamples}_C)$ arrays of chroma samples refPicLX_{Cb} and refPicLX_{Cr} .
 - Otherwise (the current macroblock is a field macroblock), the following applies.
 - Let refFrame be the reference frame or complementary reference field pair $\text{RefPicListX}[\text{refIdxLX} / 2]$.
 - The field of refFrame is selected as follows.
 - If $\text{refIdxLX} \% 2$ is equal to 0, the field of refFrame that has the same parity as the current macroblock is the output.

- Otherwise ($\text{refIdxLX} \% 2$ is equal to 1), the field of refFrame that has the opposite parity as the current macroblock is the output.
- The output reference field or field of a reference frame consists of a $(\text{PicWidthInSamples}_L) \times (\text{PicHeightInSamples}_L / 2)$ array of luma samples refPicLX_L and, when chroma_format_idc is not equal to 0 (monochrome), two $(\text{PicWidthInSamples}_C) \times (\text{PicHeightInSamples}_C / 2)$ arrays of chroma samples refPicLX_{Cb} and refPicLX_{Cr} .

The reference picture sample arrays refPicLX_L , refPicLX_{Cb} (if available), and refPicLX_{Cr} (if available) correspond to decoded sample arrays S_L , S_{Cb} (if available), S_{Cr} (if available) derived in subclause 8.7 for a previously-decoded reference field or reference frame or complementary reference field pair or field of a reference frame.

8.4.2.2 Fractional sample interpolation process

Inputs to this process are

- the current partition given by its partition index mbPartIdx and its sub-macroblock partition index subMbPartIdx ,
- the width and height partWidth , partHeight of this partition in luma-sample units,
- a luma motion vector mvLX given in quarter-luma-sample units,
- a chroma motion vector mvCLX given in eighth-chroma-sample units, and
- the selected reference picture sample arrays refPicLX_L , refPicLX_{Cb} , and refPicLX_{Cr}

Outputs of this process are

- a $(\text{partWidth}) \times (\text{partHeight})$ array predPartLX_L of prediction luma sample values and
- when chroma_format_idc is not equal to 0 (monochrome) two $(\text{partWidth}_C) \times (\text{partHeight}_C)$ arrays predPartLX_{Cb} , and predPartLX_{Cr} of prediction chroma sample values.

Let (x_{A_L}, y_{A_L}) be the location given in full-sample units of the upper-left luma sample of the current partition given by $\text{mbPartIdx} \backslash \text{subMbPartIdx}$ relative to the upper-left luma sample location of the given two-dimensional array of luma samples.

Let $(x_{\text{Int}_L}, y_{\text{Int}_L})$ be a luma location given in full-sample units and $(x_{\text{Frac}_L}, y_{\text{Frac}_L})$ be an offset given in quarter-sample units. These variables are used only inside this subclause for specifying general fractional-sample locations inside the reference sample arrays refPicLX_L , refPicLX_{Cb} (if available), and refPicLX_{Cr} (if available).

For each luma sample location $(0 \leq x_L < \text{partWidth}, 0 \leq y_L < \text{partHeight})$ inside the prediction luma sample array predPartLX_L , the corresponding prediction luma sample value $\text{predPartLX}_L[x_L, y_L]$ is derived as follows:

- The variables x_{Int_L} , y_{Int_L} , x_{Frac_L} , and y_{Frac_L} are derived by

$$x_{\text{Int}_L} = x_{A_L} + (\text{mvLX}[0] \gg 2) + x_L \quad (8-220)$$

$$y_{\text{Int}_L} = y_{A_L} + (\text{mvLX}[1] \gg 2) + y_L \quad (8-221)$$

$$x_{\text{Frac}_L} = \text{mvLX}[0] \& 3 \quad (8-222)$$

$$y_{\text{Frac}_L} = \text{mvLX}[1] \& 3 \quad (8-223)$$

- The prediction luma sample value $\text{predPartLX}_L[x_L, y_L]$ is derived by invoking the process specified in subclause 8.4.2.2.1 with $(x_{\text{Int}_L}, y_{\text{Int}_L})$, $(x_{\text{Frac}_L}, y_{\text{Frac}_L})$ and refPicLX_L given as input.

When chroma_format_idc is not equal to 0 (monochrome), the following applies.

Let $(x_{\text{Int}_C}, y_{\text{Int}_C})$ be a chroma location given in full-sample units and $(x_{\text{Frac}_C}, y_{\text{Frac}_C})$ be an offset given in one-eighth sample units. These variables are used only inside this subclause for specifying general fractional-sample locations inside the reference sample arrays refPicLX_{Cb} , and refPicLX_{Cr} .

For each chroma sample location $(0 \leq x_C < \text{partWidth}_C, 0 \leq y_C < \text{partHeight}_C)$ inside the prediction chroma sample arrays predPartLX_{Cb} and predPartLX_{Cr} , the corresponding prediction chroma sample values $\text{predPartLX}_{Cb}[x_C, y_C]$ and $\text{predPartLX}_{Cr}[x_C, y_C]$ are derived as follows:

- Depending on chroma_format_idc , the variables x_{Int_C} , y_{Int_C} , x_{Frac_C} , and y_{Frac_C} are derived as follows.
 - If chroma_format_idc is equal to 1,

$$xInt_C = (xA_L / SubWidthC) + (mvCLX[0] >> 3) + x_C \quad (8-224)$$

$$yInt_C = (yA_L / SubHeightC) + (mvCLX[1] >> 3) + y_C \quad (8-225)$$

$$xFrac_C = mvCLX[0] \& 7 \quad (8-226)$$

$$yFrac_C = mvCLX[1] \& 7 \quad (8-227)$$

- Otherwise, if chroma_format_idc is equal to 2,

$$xInt_C = (xA_L / SubWidthC) + (mvCLX[0] >> 3) + x_C \quad (8-228)$$

$$yInt_C = (yA_L / SubHeightC) + (mvCLX[1] >> 2) + y_C \quad (8-229)$$

$$xFrac_C = mvCLX[0] \& 7 \quad (8-230)$$

$$yFrac_C = (mvCLX[1] \& 3) << 1 \quad (8-231)$$

- Otherwise (chroma_format_idc is equal to 3),

$$xInt_C = (xA_L / SubWidthC) + (mvCLX[0] >> 2) + x_C \quad (8-232)$$

$$yInt_C = (yA_L / SubHeightC) + (mvCLX[1] >> 2) + y_C \quad (8-233)$$

$$xFrac_C = (mvCLX[0] \& 3) << 1 \quad (8-234)$$

$$yFrac_C = (mvCLX[1] \& 3) << 1 \quad (8-235)$$

- The prediction sample value $predPartLX_{Cb}[x_C, y_C]$ is derived by invoking the process specified in subclause 8.4.2.2.2 with $(xInt_C, yInt_C)$, $(xFrac_C, yFrac_C)$ and $refPicLX_{Cb}$ given as input.
- The prediction sample value $predPartLX_{Cr}[x_C, y_C]$ is derived by invoking the process specified in subclause 8.4.2.2.2 with $(xInt_C, yInt_C)$, $(xFrac_C, yFrac_C)$ and $refPicLX_{Cr}$ given as input.

8.4.2.2.1 Luma sample interpolation process

Inputs to this process are

- a luma location in full-sample units $(xInt_L, yInt_L)$,
- a luma location offset in fractional-sample units $(xFrac_L, yFrac_L)$, and
- the luma sample array of the selected reference picture $refPicLX_L$

Output of this process is a predicted luma sample value $predPartLX_L[x_L, y_L]$.

Figure 8-4 – Integer samples (shaded blocks with upper-case letters) and fractional sample positions (un-shaded blocks with lower-case letters) for quarter sample luma interpolation

The variable $\text{refPicHeightEffective}_L$, which is the height of the effective reference picture luma array, is derived as follows.

- If MbaffFrameFlag is equal to 0 or $\text{mb_field_decoding_flag}$ is equal to 0, $\text{refPicHeightEffective}_L$ is set equal to $\text{PicHeightInSamples}_L$.
- Otherwise (MbaffFrameFlag is equal to 1 and $\text{mb_field_decoding_flag}$ is equal to 1), $\text{refPicHeightEffective}_L$ is set equal to $\text{PicHeightInSamples}_L / 2$.

In Figure 8-4, the positions labelled with upper-case letters within shaded blocks represent luma samples at full-sample locations inside the given two-dimensional array refPicLX_L of luma samples. These samples may be used for generating the predicted luma sample value $\text{predPartLX}_L[x_L, y_L]$. The locations (xZ_L, yZ_L) for each of the corresponding luma samples Z , where Z may be A, B, C, D, E, F, G, H, I, J, K, L, M, N, P, Q, R, S, T, or U, inside the given array refPicLX_L of luma samples are derived as follows:

$$\begin{aligned} xZ_L &= \text{Clip3}(0, \text{PicWidthInSamples}_L - 1, x\text{Int}_L + xDZ_L) \\ yZ_L &= \text{Clip3}(0, \text{refPicHeightEffective}_L - 1, y\text{Int}_L + yDZ_L) \end{aligned} \quad (8-236)$$

Table 8-11 specifies (xDZ_L, yDZ_L) for different replacements of Z .

Table 8-11 – Differential full-sample luma locations

Z	A	B	C	D	E	F	G	H	I	J	K	L	M	N	P	Q	R	S	T	U
xDZ_L	0	1	0	1	-2	-1	0	1	2	3	-2	-1	0	1	2	3	0	1	0	1
yDZ_L	-2	-2	-1	-1	0	0	0	0	0	0	1	1	1	1	1	1	2	2	3	3

Given the luma samples 'A' to 'U' at full-sample locations (x_{A_L}, y_{A_L}) to (x_{U_L}, y_{U_L}), the luma samples 'a' to 's' at fractional sample positions are derived by the following rules. The luma prediction values at half sample positions shall be derived by applying a 6-tap filter with tap values (1, -5, 20, 20, -5, 1). The luma prediction values at quarter sample positions shall be derived by averaging samples at full and half sample positions. The process for each fractional position is described below.

- The samples at half sample positions labelled b shall be derived by first calculating intermediate values denoted as b_1 by applying the 6-tap filter to the nearest integer position samples in the horizontal direction. The samples at half sample positions labelled h shall be derived by first calculating intermediate values denoted as h_1 by applying the 6-tap filter to the nearest integer position samples in the vertical direction:

$$b_1 = (E - 5 * F + 20 * G + 20 * H - 5 * I + J) \quad (8-237)$$

$$h_1 = (A - 5 * C + 20 * G + 20 * M - 5 * R + T) \quad (8-238)$$

The final prediction values b and h shall be derived using:

$$b = \text{Clip1}_Y((b_1 + 16) \gg 5) \quad (8-239)$$

$$h = \text{Clip1}_Y((h_1 + 16) \gg 5) \quad (8-240)$$

- The samples at half sample position labelled as j shall be derived by first calculating intermediate value denoted as j_1 by applying the 6-tap filter to the intermediate values of the closest half sample positions in either the horizontal or vertical direction because these yield an equal result.

$$j_1 = cc - 5 * dd + 20 * h_1 + 20 * m_1 - 5 * ee + ff, \text{ or} \quad (8-241)$$

$$j_1 = aa - 5 * bb + 20 * b_1 + 20 * s_1 - 5 * gg + hh \quad (8-242)$$

where intermediate values denoted as aa, bb, gg, s_1 and hh shall be derived by applying the 6-tap filter horizontally in the same manner as the derivation of b_1 and intermediate values denoted as cc, dd, ee, m_1 and ff shall be derived by applying the 6-tap filter vertically in the same manner as the derivation of h_1 . The final prediction value j shall be derived using:

$$j = \text{Clip1}_Y((j_1 + 512) \gg 10) \quad (8-243)$$

- The final prediction values s and m shall be derived from s_1 and m_1 in the same manner as the derivation of b and h, as given by:

$$s = \text{Clip1}_Y((s_1 + 16) \gg 5) \quad (8-244)$$

$$m = \text{Clip1}_Y((m_1 + 16) \gg 5) \quad (8-245)$$

- The samples at quarter sample positions labelled as a, c, d, n, f, i, k, and q shall be derived by averaging with upward rounding of the two nearest samples at integer and half sample positions using:

$$a = (G + b + 1) \gg 1 \quad (8-246)$$

$$c = (H + b + 1) \gg 1 \quad (8-247)$$

$$d = (G + h + 1) \gg 1 \quad (8-248)$$

$$n = (M + h + 1) \gg 1 \quad (8-249)$$

$$f = (b + j + 1) \gg 1 \quad (8-250)$$

$$i = (h + j + 1) \gg 1 \quad (8-251)$$

$$k = (j + m + 1) \gg 1 \quad (8-252)$$

$$q = (j + s + 1) \gg 1. \quad (8-253)$$

- The samples at quarter sample positions labelled as e, g, p, and r shall be derived by averaging with upward rounding of the two nearest samples at half sample positions in the diagonal direction using

$$e = (b + h + 1) \gg 1 \quad (8-254)$$

$$g = (b + m + 1) \gg 1 \quad (8-255)$$

$$p = (h + s + 1) \gg 1 \quad (8-256)$$

$$r = (m + s + 1) \gg 1. \quad (8-257)$$

The luma location offset in fractional-sample units (x_{Frac_L} , y_{Frac_L}) specifies which of the generated luma samples at full-sample and fractional-sample locations is assigned to the predicted luma sample value $\text{predPartLX}_L[x_L, y_L]$. This assignment is done according to Table 8-12. The value of $\text{predPartLX}_L[x_L, y_L]$ shall be the output.

Table 8-12 – Assignment of the luma prediction sample $\text{predPartLX}_L[x_L, y_L]$

x_{Frac_L}	0	0	0	0	1	1	1	1	2	2	2	2	3	3	3	3
y_{Frac_L}	0	1	2	3	0	1	2	3	0	1	2	3	0	1	2	3
$\text{predPartLX}_L[x_L, y_L]$	G	d	h	n	a	e	i	p	b	f	j	q	c	g	k	r

8.4.2.2.2 Chroma sample interpolation process

This process shall only be invoked when chroma_format_idc is not equal to 0 (monochrome).

Inputs to this process are

- a chroma location in full-sample units (x_{Int_C} , y_{Int_C}),
- a chroma location offset in fractional-sample units (x_{Frac_C} , y_{Frac_C}), and
- chroma component samples from the selected reference picture refPicLX_C .

Output of this process is a predicted chroma sample value $\text{predPartLX}_C[x_C, y_C]$.

In Figure 8-5, the positions labelled with A, B, C, and D represent chroma samples at full-sample locations inside the given two-dimensional array refPicLX_C of chroma samples.

Figure 8-5 – Fractional sample position dependent variables in chroma interpolation and surrounding integer position samples A, B, C, and D

The variable $\text{refPicHeightEffective}_C$, which is the height of the effective reference picture chroma array, is derived as follows.

- If MbaffFrameFlag is equal to 0 or $\text{mb_field_decoding_flag}$ is equal to 0, $\text{refPicHeightEffective}_C$ is set equal to $\text{PicHeightInSamples}_C$.
- Otherwise (MbaffFrameFlag is equal to 1 and $\text{mb_field_decoding_flag}$ is equal to 1), $\text{refPicHeightEffective}_C$ is set equal to $\text{PicHeightInSamples}_C / 2$.

The sample coordinates specified in Equations 8-258 through 8-265 are used for generating the predicted chroma sample value $\text{predPartLX}_C[x_C, y_C]$.

$$x_{A_C} = \text{Clip3}(0, \text{PicWidthInSamples}_C - 1, x_{\text{Int}_C}) \quad (8-258)$$

$$x_{B_C} = \text{Clip3}(0, \text{PicWidthInSamples}_C - 1, x_{\text{Int}_C} + 1) \quad (8-259)$$

$$x_{C_C} = \text{Clip3}(0, \text{PicWidthInSamples}_C - 1, x_{\text{Int}_C}) \quad (8-260)$$

$$x_{D_C} = \text{Clip3}(0, \text{PicWidthInSamples}_C - 1, x_{\text{Int}_C} + 1) \quad (8-261)$$

$$yA_C = \text{Clip3}(0, \text{refPicHeightEffective}_C - 1, yInt_C) \quad (8-262)$$

$$yB_C = \text{Clip3}(0, \text{refPicHeightEffective}_C - 1, yInt_C) \quad (8-263)$$

$$yC_C = \text{Clip3}(0, \text{refPicHeightEffective}_C - 1, yInt_C + 1) \quad (8-264)$$

$$yD_C = \text{Clip3}(0, \text{refPicHeightEffective}_C - 1, yInt_C + 1) \quad (8-265)$$

Given the chroma samples A, B, C, and D at full-sample locations specified in Equations 8-258 through 8-265, the predicted chroma sample value $\text{predPartLX}_C[x_C, y_C]$ is derived as follows:

$$\text{predPartLX}_C[x_C, y_C] = ((8 - xFrac_C) * (8 - yFrac_C) * A + xFrac_C * (8 - yFrac_C) * B + (8 - xFrac_C) * yFrac_C * C + xFrac_C * yFrac_C * D + 32) >> 6 \quad (8-266)$$

8.4.2.3 Weighted sample prediction process

Inputs to this process are

- mbPartIdx: the current partition given by the partition index
- subMbPartIdx: the sub-macroblock partition index
- predFlagL0 and predFlagL1: prediction list utilization flags
- predPartLX_L : a (partWidth)x(partHeight) array of prediction luma samples (with LX being replaced by L0 or L1 depending on predFlagL0 and predFlagL1)
- when chroma_format_idc is not equal to 0 (monochrome), predPartLX_{Cb} and predPartLX_{Cr} : (partWidthC)x(partHeightC) arrays of prediction chroma samples, one for each of the chroma components Cb and Cr (with LX being replaced by L0 or L1 depending on predFlagL0 and predFlagL1)

Outputs of this process are

- predPart_L : a (partWidth)x(partHeight) array of prediction luma samples and
- when chroma_format_idc is not equal to 0 (monochrome), predPart_{Cb} , and predPart_{Cr} : (partWidthC)x(partHeightC) arrays of prediction chroma samples, one for each of the chroma components Cb and Cr.

For macroblocks or partitions with predFlagL0 equal to 1 in P and SP slices, the following applies.

- If weighted_pred_flag is equal to 0, the default weighted sample prediction process as described in subclause 8.4.2.3.1 is invoked with the same inputs and outputs as the process described in this subclause.
- Otherwise (weighted_pred_flag is equal to 1), the explicit weighted prediction process as described in subclause 8.4.2.3.2 is invoked with the same inputs and outputs as the process described in this subclause.

For macroblocks or partitions with predFlagL0 or predFlagL1 equal to 1 in B slices, the following applies.

- If weighted_bipred_idc is equal to 0, the default weighted sample prediction process as described in subclause 8.4.2.3.1 is invoked with the same inputs and outputs as the process described in this subclause.
- Otherwise, if weighted_bipred_idc is equal to 1, the explicit weighted sample prediction process as described in subclause 8.4.2.3.2, for macroblocks or partitions with predFlagL0 or predFlagL1 equal to 1 with the same inputs and outputs as the process described in this subclause.
- Otherwise (weighted_bipred_idc is equal to 2), the following applies.
 - If predFlagL0 is equal to 1 and predFlagL1 is equal to 1, the implicit weighted sample prediction as described in subclause 8.4.2.3.2 is invoked with the same inputs and outputs as the process described in this subclause.
 - Otherwise (predFlagL0 or predFlagL1 are equal to 1 but not both), the default weighted sample prediction process as described in subclause 8.4.2.3.1 is invoked with the same inputs and outputs as the process described in this subclause.

8.4.2.3.1 Default weighted sample prediction process

Input to this process are the same as specified in subclause 8.4.2.3.

Output of this process are the same as specified in subclause 8.4.2.3.

Depending on the available component for which the prediction block is derived, the following applies.

- If the luma sample prediction values $\text{predPart}_L[x, y]$ are derived, the following applies with C set equal to L , x set equal to $0 \dots \text{partWidth} - 1$, and y set equal to $0 \dots \text{partHeight} - 1$.
- Otherwise, if the chroma C_b component sample prediction values $\text{predPart}_{Cb}[x, y]$ are derived, the following applies with C set equal to C_b , x set equal to $0 \dots \text{partWidthC} - 1$, and y set equal to $0 \dots \text{partHeightC} - 1$.
- Otherwise (the chroma C_r component sample prediction values $\text{predPart}_{Cr}[x, y]$ are derived), the following applies with C set equal to C_r , x set equal to $0 \dots \text{partWidthC} - 1$, and y set equal to $0 \dots \text{partHeightC} - 1$.

The prediction sample values are derived as follows.

- If predFlagL0 is equal to 1 and predFlagL1 is equal to 0 for the current partition

$$\text{predPart}_C[x, y] = \text{predPartL0}_C[x, y] \quad (8-267)$$

- Otherwise, if predFlagL0 is equal to 0 and predFlagL1 is equal to 1 for the current partition

$$\text{predPart}_C[x, y] = \text{predPartL1}_C[x, y] \quad (8-268)$$

- Otherwise (predFlagL0 and predFlagL1 are equal to 1 for the current partition),

$$\text{predPart}_C[x, y] = (\text{predPartL0}_C[x, y] + \text{predPartL1}_C[x, y] + 1) \gg 1. \quad (8-269)$$

8.4.2.3.2 Weighted sample prediction process

Input to this process are the same as specified in subclause 8.4.2.3.

Output of this process are the same as specified in subclause 8.4.2.3.

Depending on the available component for which the prediction block is derived, the following applies.

- If the luma sample prediction values $\text{predPart}_L[x, y]$ are derived, the following applies with C set equal to L , x set equal to $0 \dots \text{partWidth} - 1$, and y set equal to $0 \dots \text{partHeight} - 1$.
- Otherwise, if the chroma C_b component sample prediction values $\text{predPart}_{Cb}[x, y]$ are derived, the following applies with C set equal to C_b , x set equal to $0 \dots \text{partWidthC} - 1$, and y set equal to $0 \dots \text{partHeightC} - 1$.
- Otherwise (the chroma C_r component sample prediction values $\text{predPart}_{Cr}[x, y]$ are derived), the following applies with C set equal to C_r , x set equal to $0 \dots \text{partWidthC} - 1$, and y set equal to $0 \dots \text{partHeightC} - 1$.

The prediction sample values are derived as follows

- If the partition $\text{mbPartIdx} \backslash \text{subMbPartIdx}$ has predFlagL0 equal to 1 and predFlagL1 equal to 0, the final predicted sample values $\text{predPart}_C[x, y]$ are derived by

$$\begin{aligned} &\text{if}(\log_{2}WD \geq 1) \\ &\quad \text{predPart}_C[x, y] = \text{Clip1}_C((\text{predPartL0}_C[x, y] * w_0 + 2^{\log_{2}WD - 1}) \gg \log_{2}WD) + o_0) \\ &\text{else} \\ &\quad \text{predPart}_C[x, y] = \text{Clip1}_C(\text{predPartL0}_C[x, y] * w_0 + o_0) \end{aligned} \quad (8-270)$$

- Otherwise, if the partition $\text{mbPartIdx} \backslash \text{subMbPartIdx}$ has predFlagL0 equal to 0 and predFlagL1 equal to 1, the final predicted sample values $\text{predPart}_C[x, y]$ are derived by

$$\begin{aligned} &\text{if}(\log_{2}WD \geq 1) \\ &\quad \text{predPart}_C[x, y] = \text{Clip1}_C((\text{predPartL1}_C[x, y] * w_1 + 2^{\log_{2}WD - 1}) \gg \log_{2}WD) + o_1) \\ &\text{else} \\ &\quad \text{predPart}_C[x, y] = \text{Clip1}_C(\text{predPartL1}_C[x, y] * w_1 + o_1) \end{aligned} \quad (8-271)$$

- Otherwise (the partition $\text{mbPartIdx} \backslash \text{subMbPartIdx}$ has both predFlagL0 and predFlagL1 equal to 1), the final predicted sample values $\text{predPart}_C[x, y]$ are derived by

$$\text{predPart}_C[x, y] = \text{Clip1}_C((\text{predPartL0}_C[x, y] * w_0 + \text{predPartL1}_C[x, y] * w_1 + 2^{\log_{2}WD}) \gg (\log_{2}WD + 1)) + ((o_0 + o_1 + 1) \gg 1)) \quad (8-272)$$

The variables in the above derivation for the prediction samples are derived as follows.

- If `weighted_bipred_idc` is equal to 2 and the `slice_type` is equal to B, implicit mode weighted prediction is used as follows.

$$\log WD = 5 \quad (8-273)$$

$$o_0 = 0 \quad (8-274)$$

$$o_1 = 0 \quad (8-275)$$

and w_0 and w_1 are derived as follows.

- The variables `currPicOrField`, `pic0`, and `pic1` are derived as follows:
 - If `field_pic_flag` is equal to 0 and the current macroblock is a field macroblock, the following applies.
 - `currPicOrField` is the field of the current picture `CurrPic` that has the same parity as the current macroblock.
 - The variable `pic0` is derived as follows.
 - If $\text{refIdxL0} \% 2$ is equal to 0, `pic0` is the field of `RefPicList0[refIdxL0 / 2]` that has the same parity as the current macroblock.
 - Otherwise ($\text{refIdxL0} \% 2$ is not equal to 0), `pic0` is the field of `RefPicList0[refIdxL0 / 2]` that has the opposite parity of the current macroblock.
 - The variable `pic1` is derived as follows.
 - If $\text{refIdxL1} \% 2$ is equal to 0, `pic1` is the field of `RefPicList1[refIdxL1 / 2]` that has the same parity as the current macroblock.
 - Otherwise ($\text{refIdxL1} \% 2$ is not equal to 0), `pic1` is the field of `RefPicList1[refIdxL1 / 2]` that has the opposite parity of the current macroblock.
 - Otherwise (`field_pic_flag` is equal to 1 or the current macroblock is a frame macroblock), `currPicOrField` is the current picture `CurrPic`, `pic1` is `RefPicList1[refIdxL1]`, and `pic0` is `RefPicList0[refIdxL0]`.
- The variables `tb`, `td`, `tx`, and `DistScaleFactor` are derived from the values of `currPicOrField`, `pic0`, `pic1` using Equations 8-198, 8-199, 8-194, and 8-195, respectively.
- If `DiffPicOrderCnt(pic1, pic0)` is equal to 0 or one or both of `pic1` and `pic0` is marked as "used for long-term reference" or ($\text{DistScaleFactor} \gg 2) \leq -64$ or ($\text{DistScaleFactor} \gg 2) > 128$, w_0 and w_1 are derived as

$$w_0 = 32 \quad (8-276)$$

$$w_1 = 32 \quad (8-277)$$

- Otherwise,

$$w_0 = 64 - (\text{DistScaleFactor} \gg 2) \quad (8-278)$$

$$w_1 = \text{DistScaleFactor} \gg 2 \quad (8-279)$$

- Otherwise (`weighted_pred_flag` is equal to 1 in P or SP slices or `weighted_bipred_idc` equal to 1 in B slices), explicit mode weighted prediction is used as follows.

- The variables `refIdxL0WP` and `refIdxL1WP` are derived as follows.

- If `MbaffFrameFlag` is equal to 1 and the current macroblock is a field macroblock

$$\text{refIdxL0WP} = \text{refIdxL0} \gg 1 \quad (8-280)$$

$$\text{refIdxL1WP} = \text{refIdxL1} \gg 1 \quad (8-281)$$

- Otherwise (`MbaffFrameFlag` is equal to 0 or the current macroblock is a frame macroblock),

$$\text{refIdxL0WP} = \text{refIdxL0} \quad (8-282)$$

$$\text{refIdxL1WP} = \text{refIdxL1} \quad (8-283)$$

- The variables $\log\text{WD}$, w_0 , w_1 , o_0 , and o_1 are derived as follows.

- If C in $\text{predPart}_C[x, y]$ is replaced by L for luma samples

$$\log\text{WD} = \text{luma_log2_weight_denom} \quad (8-284)$$

$$w_0 = \text{luma_weight_l0}[\text{refIdxL0WP}] \quad (8-285)$$

$$w_1 = \text{luma_weight_l1}[\text{refIdxL1WP}] \quad (8-286)$$

$$o_0 = \text{luma_offset_l0}[\text{refIdxL0WP}] * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-287)$$

$$o_1 = \text{luma_offset_l1}[\text{refIdxL1WP}] * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-288)$$

- Otherwise (C in $\text{predPart}_C[x, y]$ is replaced by Cb or Cr for chroma samples, with $i\text{CbCr} = 0$ for Cb, $i\text{CbCr} = 1$ for Cr),

$$\log\text{WD} = \text{chroma_log2_weight_denom} \quad (8-289)$$

$$w_0 = \text{chroma_weight_l0}[\text{refIdxL0WP}][i\text{CbCr}] \quad (8-290)$$

$$w_1 = \text{chroma_weight_l1}[\text{refIdxL1WP}][i\text{CbCr}] \quad (8-291)$$

$$o_0 = \text{chroma_offset_l0}[\text{refIdxL0WP}][i\text{CbCr}] * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-292)$$

$$o_1 = \text{chroma_offset_l1}[\text{refIdxL1WP}][i\text{CbCr}] * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-293)$$

When explicit mode weighted prediction is used and the partition $\text{mbPartIdx}/\text{subMbPartIdx}$ has both predFlagL0 and predFlagL1 equal to 1, the following constraint shall be obeyed

$$-128 \leq w_0 + w_1 \leq ((\log\text{WD} == 7) ? 127 : 128) \quad (8-294)$$

NOTE – For implicit mode weighted prediction, weights w_0 and w_1 are each guaranteed to be in the range of -64..128 and the constraint expressed in Equation 8-294, although not explicitly imposed, will always be met. For explicit mode weighted prediction with $\log\text{WD}$ equal to 7, when one of the two weights w_0 or w_1 is inferred to be equal to 128 (as a consequence of $\text{luma_weight_l0_flag}$, $\text{luma_weight_l1_flag}$, $\text{chroma_weight_l0_flag}$, or $\text{chroma_weight_l1_flag}$ equal to 0), the other weight (w_1 or w_0) must have a negative value in order for the constraint expressed in Equation 8-294 to hold (and therefore the other flag $\text{luma_weight_l0_flag}$, $\text{luma_weight_l1_flag}$, $\text{chroma_weight_l0_flag}$, or $\text{chroma_weight_l1_flag}$ must be equal to 1).

8.5 Transform coefficient decoding process and picture construction process prior to deblocking filter process

Inputs to this process are Intra16x16DCLevel (if available), Intra16x16ACLevel (if available), LumaLevel (if available), LumaLevel8x8 (if available), ChromaDCLevel (if available), ChromaACLevel (if available), and available Inter or Intra prediction sample arrays for the current macroblock for the applicable components pred_L , pred_{Cb} , or pred_{Cr} .

NOTE – When decoding a macroblock in Intra_4x4 (or Intra_8x8) prediction mode, the luma component of the macroblock prediction array may not be complete, since for each $4x4$ (or $8x8$) luma block, the Intra_4x4 (or Intra_8x8) prediction process for luma samples as specified in subclause 8.3.1 (or 8.3.2) and the process specified in this subclause are iterated.

Outputs of this process are the constructed sample arrays prior to the deblocking filter process for the applicable components S'_L , S'_{Cb} , or S'_{Cr} .

NOTE – When decoding a macroblock in Intra_4x4 (or Intra_8x8) prediction mode, the luma component of the macroblock constructed sample arrays prior to the deblocking filter process may not be complete, since for each $4x4$ (or $8x8$) luma block, the Intra_4x4 (or Intra_8x8) prediction process for luma samples as specified in subclause 8.3.1 (or 8.3.2) and the process specified in this subclause are iterated.

This subclause specifies transform coefficient decoding and picture construction prior to the deblocking filter process.

When the current macroblock is coded as P_Skip or B_Skip , all values of LumaLevel , LumaLevel8x8 , ChromaDCLevel , ChromaACLevel are set equal to 0 for the current macroblock.

When `residual_colour_transform_flag` is equal to 1, the residual colour transform process as specified in subclause 8.5.13 is invoked.

8.5.1 Specification of transform decoding process for 4x4 luma residual blocks

This specification applies when `transform_size_8x8_flag` is equal to 0.

When the current macroblock prediction mode is not equal to `Intra_16x16`, the variable `LumaLevel` contains the levels for the luma transform coefficients. For a 4x4 luma block indexed by `luma4x4BlkIdx = 0..15`, the following ordered steps are specified.

1. The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with `LumaLevel[ luma4x4BlkIdx ]` as the input and the two-dimensional array `c` as the output.
2. The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with `c` as the input and `r` as the output.
3. When `residual_colour_transform_flag` is equal to 1, the variable $R_{Y,ij}$ is set equal to r_{ij} with $i, j = 0..3$ and this process is suspended until after completion of the residual colour transform process as specified in subclause 8.5.13, after the completion of which, the variable r_{ij} is set equal to $R_{G,ij}$ with $i, j = 0..3$ and this process is continued.
4. The position of the upper-left sample of a 4x4 luma block with index `luma4x4BlkIdx` inside the macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with `luma4x4BlkIdx` as the input and the output being assigned to (xO, yO) .
5. The 4x4 array `u` with elements u_{ij} for $i, j = 0..3$ is derived as

$$u_{ij} = \text{Clip1}_Y(\text{pred}_L[xO + j, yO + i] + r_{ij}) \quad (8-295)$$

When `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the bitstream shall not contain data that result in a value of u_{ij} as computed by Equation 8-295 that is not equal to $\text{pred}_L[xO + j, yO + i] + r_{ij}$.

6. The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with `luma4x4BlkIdx` and `u` as the inputs.

8.5.2 Specification of transform decoding process for luma samples of Intra_16x16 macroblock prediction mode

When the current macroblock prediction mode is equal to `Intra_16x16`, the variables `Intra16x16DCLevel` and `Intra16x16ACLevel` contain the levels for the luma transform coefficients. The transform coefficient decoding proceeds in the following ordered steps:

1. The 4x4 luma DC transform coefficients of all 4x4 luma blocks of the macroblock are decoded.
 - a. The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with `Intra16x16DCLevel` as the input and the two-dimensional array `c` as the output.
 - b. The scaling and transformation process for luma DC transform coefficients for `Intra_16x16` macroblock type as specified in subclause 8.5.8 is invoked with `c` as the input and `dcY` as the output.
2. For a 4x4 luma block indexed by `luma4x4BlkIdx = 0..15`, the following ordered steps are specified.
 - a. The variable `lumaList`, which is a list of 16 entries, is derived. The first entry of `lumaList` is the corresponding value from the array `dcY`. Figure 8-6 shows the assignment of the indices of the array `dcY` to the `luma4x4BlkIdx`. The two numbers in the small squares refer to indices i and j in dcY_{ij} , and the numbers in large squares refer to `luma4x4BlkIdx`.

⁰⁰ 0	⁰¹ 1	⁰² 4	⁰³ 5
¹⁰ 2	¹¹ 3	¹² 6	¹³ 7
²⁰ 8	²¹ 9	²² 12	²³ 13
³⁰ 10	³¹ 11	³² 14	³³ 15

Figure 8-6 – Assignment of the indices of dcY to luma4x4BlkIdx

The elements in lumaList with index $k = 1..15$ are specified as

$$\text{lumaList}[k] = \text{Intra16x16ACLevel}[\text{luma4x4BlkIdx}][k - 1] \quad (8-296)$$

- The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with lumaList as the input and the two-dimensional array c as the output.
- The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with c as the input and r as the output.
- When residual_colour_transform_flag is equal to 1, the variable $R_{Y,ij}$ is set equal to r_{ij} with $i, j = 0..3$ and this process is suspended until after completion of the residual colour transform process as specified in subclause 8.5.13, after the completion of which, the variable r_{ij} is set equal to $R_{G,ij}$ with $i, j = 0..3$ and this process is continued.
- The position of the upper-left sample of a 4x4 luma block with index luma4x4BlkIdx inside the macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with luma4x4BlkIdx as the input and the output being assigned to (xO, yO) .
- The 4x4 array u with elements u_{ij} for $i, j = 0..3$ is derived as

$$u_{ij} = \text{Clip1}_Y(\text{pred}_L[xO + j, yO + i] + r_{ij}) \quad (8-297)$$

When qpprime_y_zero_transform_bypass_flag is equal to 1 and QP'_Y is equal to 0, the bitstream shall not contain data that result in a value of u_{ij} as computed by 8-297 that is not equal to $\text{pred}_L[xO + j, yO + i] + r_{ij}$.

- The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with luma4x4BlkIdx and u as the inputs.

8.5.3 Specification of transform decoding process for 8x8 luma residual blocks

This specification applies when transform_size_8x8_flag is equal to 1.

The variable LumaLevel8x8[luma8x8BlkIdx] with luma8x8BlkIdx = 0..3 contains the levels for the luma transform coefficients for the luma 8x8 block with index luma8x8BlkIdx.

For an 8x8 luma block indexed by luma8x8BlkIdx = 0..3, the following ordered steps are specified.

- The inverse scanning process for 8x8 luma transform coefficients as described in subclause 8.5.6 is invoked with LumaLevel8x8[luma8x8BlkIdx] as the input and the two-dimensional array c as the output.
- The scaling and transformation process for residual 8x8 blocks as specified in subclause 8.5.11 is invoked with c as the input and r as the output.
- When residual_colour_transform_flag is equal to 1, the variable $R_{Y,ij}$ is set equal to r_{ij} with $i, j = 0..7$ and this process is suspended until after completion of the residual colour transform process as specified in subclause 8.5.13, after the completion of which, the variable r_{ij} is set equal to $R_{G,ij}$ with $i, j = 0..7$ and this process is continued.

4. The position of the upper-left sample of an 8x8 luma block with index luma8x8BlkIdx inside the macroblock is derived by invoking the inverse 8x8 luma block scanning process in subclause 6.4.4 with luma8x8BlkIdx as the input and the output being assigned to (xO, yO).
5. The 8x8 array u with elements u_{ij} for $i, j = 0..7$ is derived as

$$u_{ij} = \text{Clip1}_Y(\text{pred}_L[xO + j, yO + i] + r_{ij}) \quad (8-298)$$

When `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the bitstream shall not contain data that result in a value of u_{ij} as computed by Equation 8-298 that is not equal to $\text{pred}_L[xO + j, yO + i] + r_{ij}$.

6. The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with luma8x8BlkIdx and u as the inputs.

8.5.4 Specification of transform decoding process for chroma samples

This process is invoked for each chroma component Cb and Cr separately.

For each chroma component, the variables `ChromaDCLevel[ iCbCr ]` and `ChromaACLevel[ iCbCr ]`, with iCbCr set equal to 0 for Cb and iCbCr set equal to 1 for Cr, contain the levels for both components of the chroma transform coefficients.

Let the variable `numChroma4x4Blks` be set equal to $(\text{MbWidthC} / 4) * (\text{MbHeightC} / 4)$.

For each chroma component, the transform decoding proceeds separately in the following ordered steps:

1. The `numChroma4x4Blks` chroma DC transform coefficients of the 4x4 chroma blocks of the component indexed by iCbCr of the macroblock are decoded.

- a. Depending on the variable `chroma_format_idc`, the following applies.
 - If `chroma_format_idc` is equal to 1, the 2x2 array c is derived using the inverse raster scanning process applied to `ChromaDCLevel` as follows

$$c = \begin{bmatrix} \text{ChromaDCLevel}[iCbCr][0] & \text{ChromaDCLevel}[iCbCr][1] \\ \text{ChromaDCLevel}[iCbCr][2] & \text{ChromaDCLevel}[iCbCr][3] \end{bmatrix} \quad (8-299)$$

- Otherwise, if `chroma_format_idc` is equal to 2, the 2x4 array c is derived using the inverse raster scanning process applied to `ChromaDCLevel` as follows

$$c = \begin{bmatrix} \text{ChromaDCLevel}[iCbCr][0] & \text{ChromaDCLevel}[iCbCr][2] \\ \text{ChromaDCLevel}[iCbCr][1] & \text{ChromaDCLevel}[iCbCr][5] \\ \text{ChromaDCLevel}[iCbCr][3] & \text{ChromaDCLevel}[iCbCr][6] \\ \text{ChromaDCLevel}[iCbCr][4] & \text{ChromaDCLevel}[iCbCr][7] \end{bmatrix} \quad (8-300)$$

- Otherwise (`chroma_format_idc` is equal to 3), the inverse scanning process for transform coefficients as specified in subclause 8.5.5 is invoked with `ChromaDCLevel[ iCbCr ]` as the input and the two-dimensional 4x4 array c as the output.

- b. The scaling and transformation process for chroma DC transform coefficients as specified in subclause 8.5.9 is invoked with c as the input and `dcC` as the output.

2. For each 4x4 chroma block indexed by `chroma4x4BlkIdx = 0..numChroma4x4Blks - 1` of the component indexed by iCbCr, the following ordered steps are specified.

- a. The variable `chromaList`, which is a list of 16 entries, is derived. The first entry of `chromaList` is the corresponding value from the array `dcC`. Figure 8-7 shows the assignment of the indices of the array `dcC` to the `chroma4x4BlkIdx`. The two numbers in the small squares refer to indices i and j in `dcCij`, and the numbers in large squares refer to `chroma4x4BlkIdx`.

Figure 8-7 – Assignment of the indices of dcC to chroma4x4BlkIdx:
(a) chroma_format_idc equal to 1, (b) chroma_format_idc equal to 2, (c) chroma_format_idc equal to 3

The elements in chromaList with index $k = 1..15$ are specified as

$$\text{chromaList}[k] = \text{ChromaACLevel}[\text{chroma4x4BlkIdx}][k - 1] \quad (8-301)$$

- b. The inverse scanning process for transform coefficients as specified in subclause 8.5.9 is invoked with chromaList as the input and the two-dimensional array c as the output.
- c. The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with c as the input and r as the output.
- d. Depending on the variable chroma_format_idc, the position of the upper-left sample of a 4x4 chroma block with index chroma4x4BlkIdx inside the macroblock is derived as follows.

- If chroma_format_idc is equal to 1 or 2, the following applies.

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 0) \quad (8-302)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 1) \quad (8-303)$$

- Otherwise (chroma_format_idc is equal to 3), the following applies.

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 0) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 0) \quad (8-304)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 1) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 1) \quad (8-305)$$

- e. When residual_colour_transform_flag is equal to 1, the variable xO' is set equal to $xO \% (4 \ll \text{transform_size_8x8_flag})$, the variable yO' is set equal to $yO \% (4 \ll \text{transform_size_8x8_flag})$, and the following applies.

- If this process is invoked for the chroma component Cb, the variable $R_{Cb,mn}$ is set equal to r_{ij} with $i, j = 0..3$, $m = xO' + i$, $n = yO' + j$, and this process is suspended until after completion of the residual colour transform process as specified in subclause 8.5.13, after which the variable r_{ij} is set equal to $R_{B,mn}$ with $i, j = 0..3$, $m = xO' + i$, $n = yO' + j$ and this process is continued.
- Otherwise (this process is invoked for the chroma component Cr), the variable $R_{Cr,mn}$ is set equal to r_{ij} with $i, j = 0..3$, $m = xO' + i$, $n = yO' + j$ and this process is suspended until after the completion of the residual colour transform process as specified in subclause 8.5.13, after which the variable r_{ij} is set equal to $R_{R,mn}$ with $i, j = 0..3$, $m = xO' + i$, $n = yO' + j$ and this process is continued.

- f. The 4x4 array u with elements u_{ij} for $i, j = 0..3$ is derived as

$$u_{ij} = \text{Clip1c}(\text{predc}[xO + j, yO + i] + r_{ij}) \quad (8-306)$$

When `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the bitstream shall not contain data that result in a value of u_{ij} as computed by Equation 8-306 that is not equal to $\text{pred}_c[xO + j, yO + i] + r_{ij}$.

- g. The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with `chroma4x4BlkIdx` and `u` as the inputs.

8.5.5 Inverse scanning process for transform coefficients

Input to this process is a list of 16 values.

Output of this process is a variable `c` containing a two-dimensional array of 4x4 values. In the case of transform coefficients, these 4x4 values represent levels assigned to locations in the transform block. In the case of applying the inverse scanning process to a scaling list, the output variable `c` contains a two-dimensional array representing a 4x4 scaling matrix.

The inverse scanning process for transform coefficients maps the sequence of transform coefficient levels to the transform coefficient level positions. Table 8-13 specifies the two mappings: inverse zig-zag scan and inverse field scan. The inverse zig-zag scan shall be used for transform coefficients in frame macroblocks and the inverse field scan shall be used for transform coefficients in field macroblocks.

The inverse scanning process for scaling lists maps the sequence of scaling list entries to the positions in the corresponding scaling matrix. For this mapping, the inverse zig-zag scan shall be used.

Figure 8-8 illustrates the scans.

Figure 8-8 – 4x4 block scans. (a) Zig-zag scan. (b) Field scan (informative)

Table 8-13 provides the mapping from the index `idx` of input list of 16 elements to indices `i` and `j` of the two-dimensional array `c`.

Table 8-13 – Specification of mapping of `idx` to c_{ij} for zig-zag and field scan

8.5.6 Inverse scanning process for 8x8 luma transform coefficients

Input to this process is a list of 64 values.

Output of this process is a variable *c* containing a two-dimensional array of 8x8 values. In the case of transform coefficients, these 8x8 values represent levels assigned to locations in the transform block. In the case of applying the inverse scanning process to a scaling list, the output variable *c* contains a two-dimensional array representing an 8x8 scaling matrix.

The inverse scanning process for transform coefficients maps the sequence of transform coefficient levels to the transform coefficient level positions. Table 8-14 specifies the two mappings: inverse 8x8 zig-zag scan and inverse 8x8 field scan. The inverse 8x8 zig-zag scan shall be used for transform coefficients in frame macroblocks and the inverse 8x8 field scan shall be used for transform coefficients in field macroblocks.

The inverse scanning process for scaling lists maps the sequence of scaling list entries to the positions in the corresponding scaling matrix. For this mapping, the inverse zig-zag scan shall be used.

Figure 8-9 illustrates the scans.

Figure 8-9 – 8x8 block scans. (a) 8x8 zig-zag scan. (b) 8x8 field scan (informative)

Table 8-14 provides the mapping from the index *idx* of the input list of 64 elements to indices *i* and *j* of the two-dimensional array *c*.

8.5.7 Derivation process for the chroma quantisation parameters and scaling function

Outputs of this process are:

- QP_C : the chroma quantisation parameter for each chroma component Cb and Cr
- QS_C : the additional chroma quantisation parameter for each chroma component Cb and Cr required for decoding SP and SI slices (if applicable)

NOTE – QP quantisation parameter values QP_Y and QS_Y are always in the range of $-QpBdOffset_Y$ to 51, inclusive. QP quantisation parameter values QP_C and QS_C are always in the range of $-QpBdOffset_C$ to 51, inclusive..

The value of QP_C for a chroma component is determined from the current value of QP_Y and the value of chroma_qp_index_offset (for Cb) or second_chroma_qp_index_offset (for Cr).

NOTE – The scaling equations are specified such that the equivalent transform coefficient level scaling factor doubles for every increment of 6 in QP_Y . Thus, there is an increase in the factor used for scaling of approximately 12 % for each increase of 1 in the value of QP_Y .

The value of QP_C for each chroma component is determined as specified in Table 8-15 based on the index denoted as qP_I .

The variable qP_{Offset} for each chroma component is derived as follows.

- If the chroma component is the Cb component, qP_{Offset} is specified as

$$qP_{Offset} = \text{chroma_qp_index_offset} \quad (8-307)$$

- Otherwise (the chroma component is the Cr component), qP_{Offset} is specified as

$$qP_{Offset} = \text{second_chroma_qp_index_offset} \quad (8-308)$$

The value of qP_I for each chroma component is derived as

$$qP_I = \text{Clip3}(-QpBdOffset_C, 51, QP_Y + qP_{Offset}) \quad (8-309)$$

The value of QP'_C for the chroma components is derived as

$$QP'_C = QP_C + QpBdOffset_C \quad (8-310)$$

The value of $\text{BitDepth}'_C$ for the chroma components is derived as

$$\text{BitDepth}'_C = \text{BitDepth}_C + \text{residual_colour_transform_flag} \quad (8-311)$$

Table 8-15 – Specification of QP_C as a function of qP_I

qP_I	<30	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51
QP_C	$=qP_I$	29	30	31	32	32	33	34	34	35	35	36	36	37	37	37	38	38	38	39	39	39	39

When the current slice is an SP or SI slice, QS_C is derived using the above process, substituting QP_Y with QS_Y and QP_C with QS_C .

The function $\text{LevelScale}(m, i, j)$ is specified as follows.

- The 4x4 matrix $\text{weightScale}(i, j)$ is specified as follows.

- The variable mbIsInterFlag is derived as follows.

- If the current macroblock is coded using Inter macroblock prediction modes, mbIsInterFlag is set equal to 1.
- Otherwise (the current macroblock is coded using Intra macroblock prediction modes), mbIsInterFlag is set equal to 0.

- The variable $iYCbCr$ derived as follows.

- If the input array c relates to a luma residual block, $iYCbCr$ is set equal to 0.

- Otherwise, if the input array c relates to a chroma residual block and the chroma component is equal to Cb, $iYCbCr$ is set equal to 1.
- Otherwise (the input array c relates to a chroma residual block and the chroma component is equal to Cr), $iYCbCr$ is set equal to 2.
- The inverse scanning process for transform coefficients as specified in subclause 8.5.5 is invoked with $\text{ScalingList4x4}[iYCbCr + ((mbIsInterFlag == 1) ? 3 : 0)]$ as the input and the output is assigned to the 4x4 matrix weightScale .

$$\text{LevelScale}(m,i,j) = \text{weightScale}(i,j) * \text{normAdjust}(m,i,j) \quad (8-312)$$

where

$$\text{normAdjust}(m,i,j) = \begin{cases} v_{m0} & \text{for } (i \% 2, j \% 2) \text{ equal to } (0,0), \\ v_{m1} & \text{for } (i \% 2, j \% 2) \text{ equal to } (1,1), \\ v_{m2} & \text{otherwise;} \end{cases} \quad (8-313)$$

where the first and second subscripts of v are row and column indices, respectively, of the matrix specified as:

$$v = \begin{bmatrix} 10 & 16 & 13 \\ 11 & 18 & 14 \\ 13 & 20 & 16 \\ 14 & 23 & 18 \\ 16 & 25 & 20 \\ 18 & 29 & 23 \end{bmatrix}. \quad (8-314)$$

The function $\text{LevelScale8x8}(m, i, j)$ is specified as follows:

- The 8x8 matrix $\text{weightScale8x8}(i, j)$ is specified as follows.
- The variable $mbIsInterFlag$ is derived as follows.
 - If the current macroblock is coded using Inter macroblock prediction modes, $mbIsInterFlag$ is set equal to 1.
 - Otherwise (the current macroblock is coded using Intra macroblock prediction modes), $mbIsInterFlag$ is set equal to 0.
- The inverse scanning process for 8x8 luma transform coefficients as specified in subclause 8.5.6 is invoked with $\text{ScalingList8x8}[mbIsInterFlag]$ as the input and the output is assigned to the 8x8 matrix weightScale8x8 .

$$\text{LevelScale8x8}(m,i,j) = \text{weightScale8x8}(i,j) * \text{normAdjust8x8}(m,i,j) \quad (8-315)$$

where

$$\text{normAdjust8x8}(m,i,j) = \begin{cases} v_{m0} & \text{for } (i \% 4, j \% 4) \text{ equal to } (0,0), \\ v_{m1} & \text{for } (i \% 2, j \% 2) \text{ equal to } (1,1), \\ v_{m2} & \text{for } (i \% 4, j \% 4) \text{ equal to } (2,2), \\ v_{m3} & \text{for } (i \% 4, j \% 2) \text{ equal to } (0,1) \text{ or } (i \% 2, j \% 4) \text{ equal to } (1,0), \\ v_{m4} & \text{for } (i \% 4, j \% 4) \text{ equal to } (0,2) \text{ or } (i \% 4, j \% 4) \text{ equal to } (2,0), \\ v_{m5} & \text{otherwise;} \end{cases} \quad (8-316)$$

where the first and second subscripts of v are row and column indices, respectively, of the matrix specified as:

$$v = \begin{bmatrix} 20 & 18 & 32 & 19 & 25 & 24 \\ 22 & 19 & 35 & 21 & 28 & 26 \\ 26 & 23 & 42 & 24 & 33 & 31 \\ 28 & 25 & 45 & 26 & 35 & 33 \\ 32 & 28 & 51 & 30 & 40 & 38 \\ 36 & 32 & 58 & 34 & 46 & 43 \end{bmatrix}. \quad (8-317)$$

8.5.8 Scaling and transformation process for luma DC transform coefficients for Intra_16x16 macroblock type

Inputs to this process are transform coefficient level values for luma DC transform coefficients of Intra_16x16 macroblocks as a 4x4 array c with elements c_{ij} , where i and j form a two-dimensional frequency index.

Outputs of this process are 16 scaled DC values for luma 4x4 blocks of Intra_16x16 macroblocks as a 4x4 array dcY with elements dcY_{ij} .

Depending on the values of $qpprime_y_zero_transform_bypass_flag$ and QP'_Y , the following applies.

- If $qpprime_y_zero_transform_bypass_flag$ is equal to 1 and QP'_Y is equal to 0, the output dcY is derived as

$$dcY_{ij} = c_{ij} \text{ with } i, j = 0..3 \quad (8-318)$$

- Otherwise ($qpprime_y_zero_transform_bypass_flag$ is equal to 0 or QP'_Y is not equal to 0), the following text of this process specifies the output.

The inverse transform for the 4x4 luma DC transform coefficients is specified by:

$$f = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix} \begin{bmatrix} c_{00} & c_{01} & c_{02} & c_{03} \\ c_{10} & c_{11} & c_{12} & c_{13} \\ c_{20} & c_{21} & c_{22} & c_{23} \\ c_{30} & c_{31} & c_{32} & c_{33} \end{bmatrix} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix}. \quad (8-319)$$

The bitstream shall not contain data that results in any element f_{ij} of f with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 1$, inclusive.

After the inverse transform, scaling is performed as follows.

- If QP'_Y is greater than or equal to 36, the scaled result shall be derived as

$$dcY_{ij} = (f_{ij} * \text{LevelScale}(QP'_Y \% 6, 0, 0)) << (QP'_Y / 6 - 6), \text{ with } i, j = 0..3. \quad (8-320)$$

- Otherwise (QP'_Y is less than 36), the scaled result shall be derived as

$$dcY_{ij} = (f_{ij} * \text{LevelScale}(QP'_Y \% 6, 0, 0) + 2^{5 - QP'_Y / 6}) >> (6 - QP'_Y / 6), \text{ with } i, j = 0..3 \quad (8-321)$$

The bitstream shall not contain data that results in any element dcY_{ij} of dcY with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 1$, inclusive.

NOTE – When $\text{entropy_coding_mode_flag}$ is equal to 0 and QP'_Y is less than 10 and profile_idc is equal to 66, 77, or 88, the range of values that can be represented for the elements c_{ij} of c is not sufficient to represent the full range of values of the elements dcY_{ij} of dcY that could be necessary to form a close approximation of the content of any possible source picture by use of the Intra_16x16 macroblock type.

NOTE – Since the range limit imposed on the elements dcY_{ij} of dcY is imposed after the right shift in Equation 8-321, a larger range of values must be supported in the decoder prior to the right shift.

8.5.9 Scaling and transformation process for chroma DC transform coefficients

Inputs to this process are transform coefficient level values for chroma DC transform coefficients of one chroma component of the macroblock as an $(\text{MbWidthC} / 4) \times (\text{MbHeightC} / 4)$ array c with elements c_{ij} , where i and j form a two-dimensional frequency index.

Outputs of this process are the scaled DC values as an $(\text{MbWidthC} / 4) \times (\text{MbHeightC} / 4)$ array dcC with elements dcC_{ij} .

Depending on the values of `qpprime_y_zero_transform_bypass_flag` and QP'_Y , the following applies.

- If `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the output dcC is derived as

$$dcC_{ij} = c_{ij} \text{ with } i = 0..(MbWidthC / 4) - 1 \text{ and } j = 0..(MbHeightC / 4) - 1. \quad (8-322)$$

- Otherwise (`qpprime_y_zero_transform_bypass_flag` is equal to 0 or QP'_Y is not equal to 0), the following text of this process specifies the output.

Depending on the variable `chroma_format_idc`, the inverse transform is specified as follows.

- If `chroma_format_idc` is equal to 1, the inverse transform for the 2x2 chroma DC transform coefficients is specified as

$$f = \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} c_{00} & c_{01} \\ c_{10} & c_{11} \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad (8-323)$$

- Otherwise, if `chroma_format_idc` is equal to 2, the inverse transform for the 2x4 chroma DC transform coefficients is specified as

$$f = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix} \begin{bmatrix} c_{00} & c_{01} \\ c_{10} & c_{11} \\ c_{20} & c_{21} \\ c_{30} & c_{31} \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad (8-324)$$

- Otherwise (`chroma_format_idc` is equal to 3), the inverse transform for the 4x4 chroma DC transform coefficients is specified as follows.

- If `residual_colour_transform_flag` is equal to 1 and the current macroblock prediction mode `MbPartPredMode(mb_type, 0)` is `Intra_4x4` or `Intra_8x8`, the inverse transform for the 4x4 chroma DC transform coefficients is specified as

$$f_{ij} = c_{ij} \ll 2 \text{ with } i, j = 0..3 \quad (8-325)$$

- Otherwise, the inverse transform for the 4x4 chroma DC transform coefficients is specified as

$$f = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix} \begin{bmatrix} c_{00} & c_{01} & c_{02} & c_{03} \\ c_{10} & c_{11} & c_{12} & c_{13} \\ c_{20} & c_{21} & c_{22} & c_{23} \\ c_{30} & c_{31} & c_{32} & c_{33} \end{bmatrix} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \\ 1 & -1 & 1 & -1 \end{bmatrix} \quad (8-326)$$

The bitstream shall not contain data that results in any element f_{ij} of f with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_C)}$ to $2^{(7 + \text{BitDepth}_C)} - 1$, inclusive.

After the inverse transform, scaling is performed depending on the variable `chroma_format_idc` as follows.

- If `chroma_format_idc` is equal to 1, the scaled result is derived as

$$dcC_{ij} = ((f_{ij} * \text{LevelScale}(QP'_C \% 6, 0, 0)) \ll (QP'_C / 6)) \gg 5, \text{ with } i, j = 0, 1 \quad (8-327)$$

- If `chroma_format_idc` is equal to 2, the following applies.

- The variable $QP'_{C,DC}$ is derived as

$$QP'_{C,DC} = QP'_C + 3 \quad (8-328)$$

- Depending on the value of $QP'_{C,DC}$, the following applies.

- If $QP'_{C,DC}$ is greater than or equal to 36, the scaled result shall be derived as

$$dcC_{ij} = (f_{ij} * LevelScale(QP'_{C,DC} \% 6, 0, 0)) << (QP'_{C,DC} / 6 - 6), \text{ with } i = 0..3, j = 0,1 \quad (8-329)$$

- Otherwise ($QP'_{C,DC}$ is less than 36), the scaled result shall be derived as

$$dcC_{ij} = (f_{ij} * LevelScale(QP'_{C,DC} \% 6, 0, 0) + 2^{5-QP'_{C,DC}/6}) >> (6 - QP'_{C,DC} / 6), \text{ with } i = 0..3, j = 0,1 \quad (8-330)$$

- Otherwise (chroma_format_idc is equal to 3), the following applies.

- If QP'_C is greater than or equal to 36, the scaled result shall be derived as

$$dcC_{ij} = (f_{ij} * LevelScale(QP'_C \% 6, 0, 0)) << (QP'_C / 6 - 6), \text{ with } i, j = 0..3. \quad (8-331)$$

- Otherwise (QP'_C is less than 36), the scaled result shall be derived as

$$dcC_{ij} = (f_{ij} * LevelScale(QP'_C \% 6, 0, 0) + 2^{5-QP'_C/6}) >> (6 - QP'_C / 6), \text{ with } i, j = 0..3. \quad (8-332)$$

The bitstream shall not contain data that results in any element dcC_{ij} of dcC with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}'_C)}$ to $2^{(7 + \text{BitDepth}'_C)} - 1$, inclusive.

NOTE – When entropy_coding_mode_flag is equal to 0 and QP'_C is less than 4 and profile_idc is equal to 66, 77, or 88, the range of values that can be represented for the elements c_{ij} of c may not be sufficient to represent the full range of values of the elements dcC_{ij} of dcC that could be necessary to form a close approximation of the content of any possible source picture.

NOTE – Since the range limit imposed on the elements dcC_{ij} of dcC is imposed after the right shift in Equation 8-327, 8-330, or 8-332, a larger range of values must be supported in the decoder prior to the right shift.

8.5.10 Scaling and transformation process for residual 4x4 blocks

Input to this process is a 4x4 array c with elements c_{ij} which is either an array relating to a residual block of the luma component or an array relating to a residual block of a chroma component.

Outputs of this process are residual sample values as 4x4 array r with elements r_{ij} .

Depending on the values of `qpprime_y_zero_transform_bypass_flag` and QP'_Y , the following applies.

- If `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the output r is derived as

$$r_{ij} = c_{ij} \text{ with } i, j = 0..3 \quad (8-333)$$

- Otherwise (`qpprime_y_zero_transform_bypass_flag` is equal to 0 or QP'_Y is not equal to 0), the following text of this process specifies the output

The variable `bitDepth` is derived as follows.

- If the input array c relates to a luma residual block, `bitDepth` is set equal to `BitDepthY`.
- Otherwise (the input array c relates to a chroma residual block), `bitDepth` is set equal to `BitDepthC`.

The bitstream shall not contain data that results in any element c_{ij} of c with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{bitDepth})}$ to $2^{(7 + \text{bitDepth})} - 1$, inclusive.

The variable `sMbFlag` is derived as follows.

- If `mb_type` is equal to SI or the macroblock prediction mode is equal to Inter in an SP slice, `sMbFlag` is set equal to 1,
- Otherwise (`mb_type` not equal to SI and the macroblock prediction mode is not equal to Inter in an SP slice), `sMbFlag` is set equal to 0.

The variable `qP` is derived as follows.

- If the input array c relates to a luma residual block and `sMbFlag` is equal to 0

$$qP = QP'_Y \quad (8-334)$$

- Otherwise, if the input array c relates to a luma residual block and $sMbFlag$ is equal to 1

$$qP = QS_Y \quad (8-335)$$

- Otherwise, if the input array c relates to a chroma residual block and $sMbFlag$ is equal to 0

$$qP = QP'_C \quad (8-336)$$

- Otherwise (the input array c relates to a chroma residual block and $sMbFlag$ is equal to 1),

$$qP = QS_C \quad (8-337)$$

Scaling of 4x4 block transform coefficient levels c_{ij} proceeds as follows.

- If all of the following conditions are true

- i is equal to 0
- j is equal to 0
- c relates to a luma residual block coded using Intra_16x16 prediction mode or c relates to a chroma residual block

the variable d_{00} is derived by

$$d_{00} = c_{00} \quad (8-338)$$

- Otherwise, the following applies.

- If qP is greater than or equal to 24, the scaled result shall be derived as follows

$$d_{ij} = (c_{ij} * LevelScale(qP \% 6, i, j)) << (qP / 6 - 4), \text{ with } i, j = 0..3 \text{ except as noted above} \quad (8-339)$$

- Otherwise (qP is less than 24), the scaled result shall be derived as follows

$$d_{ij} = (c_{ij} * LevelScale(qP \% 6, i, j) + 2^{3-qP/6}) >> (4 - qP / 6), \text{ with } i, j = 0..3 \text{ except as noted above} \quad (8-340)$$

The bitstream shall not contain data that results in any element d_{ij} of d with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + bitDepth)}$ to $2^{(7 + bitDepth)} - 1$, inclusive.

The transform process shall convert the block of scaled transform coefficients to a block of output samples in a manner mathematically equivalent to the following.

First, each (horizontal) row of scaled transform coefficients is transformed using a one-dimensional inverse transform as follows.

A set of intermediate values is computed as follows.

$$e_{i0} = d_{i0} + d_{i2}, \text{ with } i = 0..3 \quad (8-341)$$

$$e_{i1} = d_{i0} - d_{i2}, \text{ with } i = 0..3 \quad (8-342)$$

$$e_{i2} = (d_{i1} >> 1) - d_{i3}, \text{ with } i = 0..3 \quad (8-343)$$

$$e_{i3} = d_{i1} + (d_{i3} >> 1), \text{ with } i = 0..3 \quad (8-344)$$

The bitstream shall not contain data that results in any element e_{ij} of e with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + bitDepth)}$ to $2^{(7 + bitDepth)} - 1$, inclusive.

Then, the transformed result is computed from these intermediate values as follows.

$$f_{i0} = e_{i0} + e_{i3}, \text{ with } i = 0..3 \quad (8-345)$$

$$f_{i1} = e_{i1} + e_{i2}, \text{ with } i = 0..3 \quad (8-346)$$

$$f_{i2} = e_{i1} - e_{i2}, \text{ with } i = 0..3 \quad (8-347)$$

$$f_{i3} = e_{i0} - e_{i3}, \text{ with } i = 0..3 \quad (8-348)$$

The bitstream shall not contain data that results in any element f_{ij} of f with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{bitDepth})}$ to $2^{(7 + \text{bitDepth})} - 1$, inclusive.

Then, each (vertical) column of the resulting matrix is transformed using the same one-dimensional inverse transform as follows.

A set of intermediate values is computed as follows.

$$g_{0j} = f_{0j} + f_{2j}, \text{ with } j = 0..3 \quad (8-349)$$

$$g_{1j} = f_{0j} - f_{2j}, \text{ with } j = 0..3 \quad (8-350)$$

$$g_{2j} = (f_{1j} >> 1) - f_{3j}, \text{ with } j = 0..3 \quad (8-351)$$

$$g_{3j} = f_{1j} + (f_{3j} >> 1), \text{ with } j = 0..3 \quad (8-352)$$

The bitstream shall not contain data that results in any element g_{ij} of g with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{bitDepth})}$ to $2^{(7 + \text{bitDepth})} - 1$, inclusive.

Then, the transformed result is computed from these intermediate values as follows.

$$h_{0j} = g_{0j} + g_{3j}, \text{ with } j = 0..3 \quad (8-353)$$

$$h_{1j} = g_{1j} + g_{2j}, \text{ with } j = 0..3 \quad (8-354)$$

$$h_{2j} = g_{1j} - g_{2j}, \text{ with } j = 0..3 \quad (8-355)$$

$$h_{3j} = g_{0j} - g_{3j}, \text{ with } j = 0..3 \quad (8-356)$$

The bitstream shall not contain data that results in any element h_{ij} of h with $i, j = 0..3$ that exceeds the range of integer values from $-2^{(7 + \text{bitDepth})}$ to $2^{(7 + \text{bitDepth})} - 33$, inclusive.

After performing both the one-dimensional horizontal and the one-dimensional vertical inverse transforms to produce an array of transformed samples, the final constructed residual sample values shall be derived as

$$r_{ij} = (h_{ij} + 2^5) >> 6, \text{ with } i, j = 0..3 \quad (8-357)$$

8.5.11 Scaling and transformation process for residual 8x8 luma blocks

Input to this process is an 8x8 array c with elements c_{ij} which is an array relating to an 8x8 residual block of the luma component.

Outputs of this process are residual sample values as 8x8 array r with elements r_{ij} .

Depending on the values of `qpprime_y_zero_transform_bypass_flag` and QP'_Y , the following applies.

- If `qpprime_y_zero_transform_bypass_flag` is equal to 1 and QP'_Y is equal to 0, the output r is derived as

$$r_{ij} = c_{ij} \text{ with } i, j = 0..7 \quad (8-358)$$

- Otherwise (`qpprime_y_zero_transform_bypass_flag` is equal to 0 or QP'_Y is not equal to 0), the following text of this process specifies the output.

The bitstream shall not contain data that results in any element c_{ij} of c with $i, j = 0..7$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 1$, inclusive.

The scaling process for 8x8 block transform coefficient levels c_{ij} proceeds as follows.

- If QP'_Y is greater than or equal to 36, the scaled result shall be derived as

$$d_{ij} = (c_{ij} * \text{LevelScale8x8}(QP'_Y \% 6, i, j)) \ll (QP'_Y / 6 - 6), \text{ with } i, j = 0..7. \quad (8-359)$$

- Otherwise (QP'_Y is less than 36), the scaled result shall be derived as

$$d_{ij} = (c_{ij} * \text{LevelScale8x8}(QP'_Y \% 6, i, j) + 2^{5-QP'_Y/6}) \gg (6 - QP'_Y / 6), \text{ with } i, j = 0..7. \quad (8-360)$$

The bitstream shall not contain data that results in any element d_{ij} of d with $i, j = 0..7$ that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 1$, inclusive.

The transform process shall convert the block of scaled transform coefficients to a block of output samples in a manner mathematically equivalent to the following.

First, each (horizontal) row of scaled transform coefficients is transformed using a one-dimensional inverse transform as follows.

- A set of intermediate values e_{ij} is derived by

$$e_{i0} = d_{i0} + d_{i4}, \text{ with } i = 0..7 \quad (8-361)$$

$$e_{i1} = -d_{i3} + d_{i5} - d_{i7} - (d_{i7} \gg 1), \text{ with } i = 0..7 \quad (8-362)$$

$$e_{i2} = d_{i0} - d_{i4}, \text{ with } i = 0..7 \quad (8-363)$$

$$e_{i3} = d_{i1} + d_{i7} - d_{i3} - (d_{i3} \gg 1), \text{ with } i = 0..7 \quad (8-364)$$

$$e_{i4} = (d_{i2} \gg 1) - d_{i6}, \text{ with } i = 0..7 \quad (8-365)$$

$$e_{i5} = -d_{i1} + d_{i7} + d_{i5} + (d_{i5} \gg 1), \text{ with } i = 0..7 \quad (8-366)$$

$$e_{i6} = d_{i2} + (d_{i6} \gg 1), \text{ with } i = 0..7 \quad (8-367)$$

$$e_{i7} = d_{i3} + d_{i5} + d_{i1} + (d_{i1} \gg 1), \text{ with } i = 0..7 \quad (8-368)$$

- A second set of intermediate results f_{ij} is computed from the intermediate values e_{ij} as

$$f_{i0} = e_{i0} + e_{i6}, \text{ with } i = 0..7 \quad (8-369)$$

$$f_{i1} = e_{i1} + (e_{i7} \gg 2), \text{ with } i = 0..7 \quad (8-370)$$

$$f_{i2} = e_{i2} + e_{i4}, \text{ with } i = 0..7 \quad (8-371)$$

$$f_{i3} = e_{i3} + (e_{i5} \gg 2), \text{ with } i = 0..7 \quad (8-372)$$

$$f_{i4} = e_{i0} - e_{i4}, \text{ with } i = 0..7 \quad (8-373)$$

$$f_{i5} = (e_{i3} \gg 2) - e_{i5}, \text{ with } i = 0..7 \quad (8-374)$$

$$f_{i6} = e_{i0} - e_{i6}, \text{ with } i = 0..7 \quad (8-375)$$

$$f_{i7} = e_{i7} - (e_{i1} \gg 2), \text{ with } i = 0..7 \quad (8-376)$$

- Then, the transformed result g_{ij} is computed from these intermediate values f_{ij} as

$$g_{i0} = f_{i0} + f_{i7}, \text{ with } i = 0..7 \quad (8-377)$$

$$g_{i1} = f_{i2} + f_{i5}, \text{ with } i = 0..7 \quad (8-378)$$

$$g_{i2} = f_{i4} + f_{i3}, \text{ with } i = 0..7 \quad (8-379)$$

$$g_{i3} = f_{i6} + f_{i1}, \text{ with } i = 0..7 \quad (8-380)$$

$$g_{i4} = f_{i6} - f_{i1}, \text{ with } i = 0..7 \quad (8-381)$$

$$g_{i5} = f_{i4} - f_{i3}, \text{ with } i = 0..7 \quad (8-382)$$

$$g_{i6} = f_{i2} - f_{i5}, \text{ with } i = 0..7 \quad (8-383)$$

$$g_{i7} = f_{i0} - f_{i7}, \text{ with } i = 0..7 \quad (8-384)$$

Then, each (vertical) column of the resulting matrix is transformed using the same one-dimensional inverse transform as follows.

- A set of intermediate values h_{ij} is computed from the horizontally transformed value g_{ij} as

$$h_{0j} = g_{0j} + g_{4j}, \text{ with } j = 0..7 \quad (8-385)$$

$$h_{1j} = -g_{3j} + g_{5j} - g_{7j} - (g_{7j} >> 1), \text{ with } j = 0..7 \quad (8-386)$$

$$h_{2j} = g_{0j} - g_{4j}, \text{ with } j = 0..7 \quad (8-387)$$

$$h_{3j} = g_{1j} + g_{7j} - g_{3j} - (g_{3j} >> 1), \text{ with } j = 0..7 \quad (8-388)$$

$$h_{4j} = (g_{2j} >> 1) - g_{6j}, \text{ with } j = 0..7 \quad (8-389)$$

$$h_{5j} = -g_{1j} + g_{7j} + g_{5j} + (g_{5j} >> 1), \text{ with } j = 0..7 \quad (8-390)$$

$$h_{6j} = g_{2j} + (g_{6j} >> 1), \text{ with } j = 0..7 \quad (8-391)$$

$$h_{7j} = g_{3j} + g_{5j} + g_{1j} + (g_{1j} >> 1), \text{ with } j = 0..7 \quad (8-392)$$

- A second set of intermediate results k_{ij} is computed from the intermediate values h_{ij} as

$$k_{0j} = h_{0j} + h_{6j}, \text{ with } j = 0..7 \quad (8-393)$$

$$k_{1j} = h_{1j} + (h_{7j} >> 2), \text{ with } j = 0..7 \quad (8-394)$$

$$k_{2j} = h_{2j} + h_{4j}, \text{ with } j = 0..7 \quad (8-395)$$

$$k_{3j} = h_{3j} + (h_{5j} >> 2), \text{ with } j = 0..7 \quad (8-396)$$

$$k_{4j} = h_{2j} - h_{4j}, \text{ with } j = 0..7 \quad (8-397)$$

$$k_{5j} = (h_{3j} >> 2) - h_{5j}, \text{ with } j = 0..7 \quad (8-398)$$

$$k_{6j} = h_{0j} - h_{6j}, \text{ with } j = 0..7 \quad (8-399)$$

$$k_{7j} = h_{7j} - (h_{1j} >> 2), \text{ with } j = 0..7 \quad (8-400)$$

- Then, the transformed result m_{ij} is computed from these intermediate values k_{ij} as

$$m_{0j} = k_{0j} + k_{7j}, \text{ with } j = 0..7 \quad (8-401)$$

$$m_{1j} = k_{2j} + k_{5j}, \text{ with } j = 0..7 \quad (8-402)$$

$$m_{2j} = k_{4j} + k_{3j}, \text{ with } j = 0..7 \quad (8-403)$$

$$m_{3j} = k_{6j} + k_{1j}, \text{ with } j = 0..7 \quad (8-404)$$

$$m_{4j} = k_{6j} - k_{1j}, \text{ with } j = 0..7 \quad (8-405)$$

$$m_{5j} = k_{4j} - k_{3j}, \text{ with } j = 0..7 \quad (8-406)$$

$$m_{6j} = k_{2j} - k_{5j}, \text{ with } j = 0..7 \quad (8-407)$$

$$m_{7j} = k_{0j} - k_{7j}, \text{ with } j = 0..7 \quad (8-408)$$

The bitstream shall not contain data that results in any element e_{ij} , f_{ij} , g_{ij} , h_{ij} , or k_{ij} for i and j in the range of 0..7, inclusive, that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 1$, inclusive.

The bitstream shall not contain data that results in any element m_{ij} for i and j in the range of 0..7, inclusive, that exceeds the range of integer values from $-2^{(7 + \text{BitDepth}_Y)}$ to $2^{(7 + \text{BitDepth}_Y)} - 33$, inclusive.

After performing both the one-dimensional horizontal and the one-dimensional vertical inverse transforms to produce an array of transformed samples, the final constructed residual sample values shall be derived as

$$r_{ij} = (m_{ij} + 2^5) >> 6 \text{ with } i, j = 0..7 \quad (8-409)$$

8.5.12 Picture construction process prior to deblocking filter process

Inputs to this process are

- luma4x4BlkIdx or chroma4x4BlkIdx or luma8x8BlkIdx
- a sample array u with elements u_{ij} which is either a 4x4 luma block or a 4x4 chroma block or an 8x8 luma block

The position of the upper-left luma sample of the current macroblock is derived by invoking the inverse macroblock scanning process in subclause 6.4.1 with CurrMbAddr as input and the output being assigned to (xP , yP).

When u is a luma block, for each sample u_{ij} of the luma block, the following applies.

- Depending on the size of the block u , the following applies.
 - If u is an 4x4 luma block, the position of the upper-left sample of the 4x4 luma block with index luma4x4BlkIdx inside the macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with luma4x4BlkIdx as the input and the output being assigned to (xO , yO), and the variable nE is set equal to 4.
 - Otherwise (u is an 8x8 luma block), the position of the upper-left sample of the 8x8 luma block with index luma8x8BlkIdx inside the macroblock is derived by invoking the inverse 8x8 luma block scanning process in subclause 6.4.4 with luma8x8BlkIdx as the input and the output being assigned to (xO , yO), and the variable nE is set equal to 8.
- Depending on the variable MbaffFrameFlag and the current macroblock, the following applies.
 - If MbaffFrameFlag is equal to 1 and the current macroblock is a field macroblock

$$S'_L[xP + xO + j, yP + 2 * (yO + i)] = u_{ij} \text{ with } i, j = 0..nE - 1 \quad (8-410)$$

- Otherwise (MbaffFrameFlag is equal to 0 or the current macroblock is a frame macroblock),

$$S'_L[xP + xO + j, yP + yO + i] = u_{ij} \text{ with } i, j = 0..nE - 1 \quad (8-411)$$

When u is a chroma block, for each sample u_{ij} of the 4x4 chroma block, the following applies.

- The subscript C in the variable S'_C is replaced with Cb for the Cb chroma component and with Cr for the Cr chroma component.
- Depending on the variable chroma_format_idc, the position of the upper-left sample of a 4x4 chroma block with index chroma4x4BlkIdx inside the macroblock is derived as follows.
 - If chroma_format_idc is equal to 1 or 2, the following applies.

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 0) \quad (8-412)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 1) \quad (8-413)$$

- Otherwise (chroma_format_idc is equal to 3), the following applies.

$$xO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 0) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 0) \quad (8-414)$$

$$yO = \text{InverseRasterScan}(\text{chroma4x4BlkIdx} / 4, 8, 8, 16, 1) + \text{InverseRasterScan}(\text{chroma4x4BlkIdx} \% 4, 4, 4, 8, 1) \quad (8-415)$$

- Depending on the variable MbaffFrameFlag and the current macroblock, the following applies.

- If MbaffFrameFlag is equal to 1 and the current macroblock is a field macroblock

$$S'_c[(xP / \text{subWidthC}) + xO + j, ((yP + \text{SubHeightC} - 1) / \text{SubHeightC}) + 2 * (yO + i)] = u_{ij} \text{ with } i, j = 0..3 \quad (8-416)$$

- Otherwise (MbaffFrameFlag is equal to 0 or the current macroblock is a frame macroblock),

$$S'_c[(xP / \text{subWidthC}) + xO + j, (yP / \text{SubHeightC}) + yO + i] = u_{ij} \text{ with } i, j = 0..3 \quad (8-417)$$

8.5.13 Residual colour transform process

This process is invoked when residual_colour_transform_flag is equal to 1.

After invoking, this process is suspended until the derivation of $R_{Y,ij}$, $R_{Cb,ij}$, and $R_{Cr,ij}$ has been completed for $i, j = 0..ijMax$, where $ijMax$ is specified as follows.

- If transform_size_8x8_flag is equal to 0, the variable $ijMax$ is set equal to 3.
- Otherwise (transform_size_8x8_flag is equal to 1), the variable $ijMax$ is set equal to 7.

At the resumption of this process, all values $R_{Y,ij}$, $R_{Cb,ij}$, and $R_{Cr,ij}$ with $i, j = 0..ijMax$ shall be available through prior invocations of the relevant processes specified in subclauses 8.5.1, 8.5.2, 0, or 8.5.4

For each $i, j = 0..ijMax$, the residual colour transform is computed as

$$t = R_{Y,ij} - (R_{Cb,ij} \ggg 1) \quad (8-418)$$

$$R_{G,ij} = t + R_{Cb,ij} \quad (8-419)$$

$$R_{B,ij} = t - (R_{Cr,ij} \ggg 1) \quad (8-420)$$

$$R_{R,ij} = R_{B,ij} + R_{Cr,ij} \quad (8-421)$$

NOTE – The residual colour transform is similar to the YCgCo transformation specified in Equations E-30 through E-33. However, the residual colour transform operates on the decoded residual difference data within the decoding process rather than operating as a post-processing step that is outside the decoding process specified in this Recommendation | International Standard.

8.6 Decoding process for P macroblocks in SP slices or SI macroblocks

This process is invoked when decoding P macroblock types in an SP slice type or an SI macroblock type in SI slices.

Inputs to this process are the prediction residual transform coefficient levels and the predicted samples for the current macroblock.

Outputs of this process are the decoded samples of the current macroblock prior to the deblocking filter process.

This subclause specifies the transform coefficient decoding process and picture construction process for P macroblock types in SP slices and SI macroblock type in SI slices.

NOTE – SP slices make use of Inter predictive coding to exploit temporal redundancy in the sequence, in a similar manner to P slice coding. Unlike P slice coding, however, SP slice coding allows identical reconstruction of a slice even when different reference pictures are being used. SI slices make use of spatial prediction, in a similar manner to I slices. SI slice coding allows identical reconstruction to a corresponding SP slice. The properties of SP and SI slices aid in providing functionalities for bitstream switching, splicing, random access, fast-forward, fast reverse, and error resilience/recovery.

An SP slice consists of macroblocks coded either as I macroblock types or P macroblock types.

An SI slice consists of macroblocks coded either as I macroblock types or SI macroblock type.

The transform coefficient decoding process and picture construction process prior to deblocking filter process for I macroblock types in SI slices shall be invoked as specified in subclause 8.5. SI macroblock type shall be decoded as described below.

When the current macroblock is coded as P_Skip, all values of LumaLevel, ChromaDCLevel, ChromaACLevel are set equal to 0 for the current macroblock.

8.6.1 SP decoding process for non-switching pictures

This process is invoked, when decoding P macroblock types in SP slices in which sp_for_switch_flag is equal to 0.

Inputs to this process are Inter prediction samples for the current macroblock from subclause 8.4 and the prediction residual transform coefficient levels.

Outputs of this process are the decoded samples of the current macroblock prior to the deblocking filter process.

This subclause applies to all macroblocks in SP slices in which sp_for_switch_flag is equal to 0, except those with macroblock prediction mode equal to Intra_4x4 or Intra_16x16. It does not apply to SI slices.

8.6.1.1 Luma transform coefficient decoding process

Inputs to this process are Inter prediction luma samples for the current macroblock pred_L from subclause 8.4 and the prediction residual transform coefficient levels, LumaLevel, and the index of the 4x4 luma block luma4x4BlkIdx.

The position of the upper-left sample of the 4x4 luma block with index luma4x4BlkIdx inside the current macroblock is derived by invoking the inverse 4x4 luma block scanning process in subclause 6.4.3 with luma4x4BlkIdx as the input and the output being assigned to (x, y).

Let the variable p be a 4x4 array of prediction samples with element p_{ij} being derived as follows.

$$p_{ij} = \text{pred}_L[x + j, y + i] \quad \text{with } i, j = 0..3 \quad (8-422)$$

The variable p is transformed producing transform coefficients c^p according to:

$$c^p = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 2 & 1 & -1 & -2 \\ 1 & -1 & -1 & 1 \\ 1 & -2 & 2 & -1 \end{bmatrix} \begin{bmatrix} p_{00} & p_{01} & p_{02} & p_{03} \\ p_{10} & p_{11} & p_{12} & p_{13} \\ p_{20} & p_{21} & p_{22} & p_{23} \\ p_{30} & p_{31} & p_{32} & p_{33} \end{bmatrix} \begin{bmatrix} 1 & 2 & 1 & 1 \\ 1 & 1 & -1 & -2 \\ 1 & -1 & -1 & 2 \\ 1 & -2 & 1 & -1 \end{bmatrix} \quad (8-423)$$

The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with LumaLevel[luma4x4BlkIdx] as the input and the two-dimensional array c^r with elements c_{ij}^r as the output.

The prediction residual transform coefficients c^r are scaled using quantisation parameter QP_Y, and added to the transform coefficients of the prediction block c^p with i, j = 0..3 as follows.

$$c_{ij}^s = c_{ij}^p + ((c_{ij}^r * \text{LevelScale}(QP_Y \% 6, i, j) * A_{ij}) << (QP_Y / 6)) >> 10) \quad (8-424)$$

where LevelScale(m, i, j) is specified in Equation 8-312, and where A_{ij} is specified as:

$$A_{ij} = \begin{cases} 16 & \text{for } (i, j) \in \{(0,0), (0,2), (2,0), (2,2)\}, \\ 25 & \text{for } (i, j) \in \{(1,1), (1,3), (3,1), (3,3)\}, \\ 20 & \text{otherwise;} \end{cases} \quad (8-425)$$

The function LevelScale2(m, i, j), used in the formulas below, is specified as:

$$\text{LevelScale2}(m, i, j) = \begin{cases} w_{m0} & \text{for } (i, j) \in \{(0,0), (0,2), (2,0), (2,2)\}, \\ w_{m1} & \text{for } (i, j) \in \{(1,1), (1,3), (3,1), (3,3)\}, \\ w_{m2} & \text{otherwise;} \end{cases} \quad (8-426)$$

where the first and second subscripts of w are row and column indices, respectively, of the matrix specified as:

$$w = \begin{bmatrix} 13107 & 5243 & 8066 \\ 11916 & 4660 & 7490 \\ 10082 & 4194 & 6554 \\ 9362 & 3647 & 5825 \\ 8192 & 3355 & 5243 \\ 7282 & 2893 & 4559 \end{bmatrix} \quad (8-427)$$

The resulting sum, c^s , is quantised with a quantisation parameter QS_Y and with $i, j = 0..3$ as follows.

$$c_{ij} = \text{Sign}(c_{ij}^s) * ((\text{Abs}(c_{ij}^s) * \text{LevelScale2}(QS_Y \% 6, i, j) + (1 \ll (14 + QS_Y / 6))) \gg (15 + QS_Y / 6)) \quad (8-428)$$

The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with c as the input and r as the output.

The 4x4 array u with elements u_{ij} is derived as follows.

$$u_{ij} = \text{Clip1}_Y(r_{ij}) \text{ with } i, j = 0..3 \quad (8-429)$$

The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with luma4x4BlkIdx and u as the inputs.

8.6.1.2 Chroma transform coefficient decoding process

Inputs to this process are Inter prediction chroma samples for the current macroblock from subclause 8.4 and the prediction residual transform coefficient levels, ChromaDCLevel and ChromaACLevel .

This process is invoked twice: once for the Cb component and once for the Cr component. The component is referred to by replacing C with Cb for the Cb component and C with Cr for the Cr component. Let $iCbCr$ select the current chroma component.

For each 4x4 block of the current chroma component indexed using chroma4x4BlkIdx with chroma4x4BlkIdx equal to 0..3, the following applies.

- The position of the upper-left sample of a 4x4 chroma block with index chroma4x4BlkIdx inside the macroblock is derived as follows.

$$x = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 0) \quad (8-430)$$

$$y = \text{InverseRasterScan}(\text{chroma4x4BlkIdx}, 4, 4, 8, 1) \quad (8-431)$$

- Let p be a 4x4 array of prediction samples with elements p_{ij} being derived as follows.

$$p_{ij} = \text{pred}_C[x + j, y + i] \text{ with } i, j = 0..3 \quad (8-432)$$

- The 4x4 array p is transformed producing transform coefficients $c^p(\text{chroma4x4BlkIdx})$ using Equation 8-423.
- The variable chromaList , which is a list of 16 entries, is derived. $\text{chromaList}[0]$ is set equal to 0. $\text{chromaList}[k]$ with index $k = 1..15$ are specified as follows.

$$\text{chromaList}[k] = \text{ChromaACLevel}[iCbCr][\text{chroma4x4BlkIdx}][k - 1] \quad (8-433)$$

- The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with chromaList as the input and the 4x4 array c^r as the output.
- The prediction residual transform coefficients c^r are scaled using quantisation parameter QP_C , and added to the transform coefficients of the prediction block c^p with $i, j = 0..3$ except for the combination $i = 0, j = 0$ as follows.

$$c_{ij}^s = c_{ij}^p(\text{chroma4x4BlkIdx}) + (((c_{ij}^r * \text{LevelScale}(QP_C \% 6, i, j) * A_{ij}) << (QP_C / 6)) >> 10) \quad (8-434)$$

- The resulting sum, c^s , is quantised with a quantisation parameter QS_C and with $i, j = 0..3$ except for the combination $i = 0, j = 0$ as follows. The derivation of $c_{00}(\text{chroma4x4BlkIdx})$ is described below in this subclause.

$$c_{ij}(\text{chroma4x4BlkIdx}) = (\text{Sign}(c_{ij}^s) * (\text{Abs}(c_{ij}^s) * \text{LevelScale2}(QS_C \% 6, i, j) + (1 << (14 + QS_C / 6)))) >> (15 + QS_C / 6) \quad (8-435)$$

- The scaling and transformation process for residual 4x4 blocks as specified in 8.5.10 is invoked with $c(\text{chroma4x4BlkIdx})$ as the input and r as the output.
- The 4x4 array u with elements u_{ij} is derived as follows.

$$u_{ij} = \text{Clip1}_C(r_{ij}) \text{ with } i, j = 0..3 \quad (8-436)$$

- The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with chroma4x4BlkIdx and u as the inputs.

The derivation of the DC transform coefficient level $c_{00}(\text{chroma4x4BlkIdx})$ is specified as follows. The DC transform coefficients of the 4 prediction chroma 4x4 blocks of the current component of the macroblock are assembled into a 2x2 matrix with elements $c_{00}^p(\text{chroma4x4BlkIdx})$ and a 2x2 transform is applied to the DC transform coefficients as follows

$$dc^p = \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} c_{00}^p(0) & c_{00}^p(1) \\ c_{00}^p(2) & c_{00}^p(3) \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad (8-437)$$

The chroma DC prediction residual transform coefficient levels, $\text{ChromaDCLevel}[iCbCr][k]$ with $k = 0..3$ are scaled using quantisation parameter QP , and added to the prediction DC transform coefficients as follows.

$$dc_{ij}^s = dc_{ij}^p + (((\text{ChromaDCLevel}[iCbCr][j * 2 + i] * \text{LevelScale}(QP_C \% 6, 0, 0) * A_{00}) << (QP_C / 6)) >> 9) \text{ with } i, j = 0, 1 \quad (8-438)$$

The 2x2 array dc^s , is quantised using the quantisation parameter QS_C as follows.

$$dc_{ij}^r = (\text{Sign}(dc_{ij}^s) * (\text{Abs}(dc_{ij}^s) * \text{LevelScale2}(QS_C \% 6, 0, 0) + (1 << (15 + QS_C / 6)))) >> (16 + QS_C / 6) \text{ with } i, j = 0, 1 \quad (8-439)$$

The 2x2 array f with elements f_{ij} and $i, j = 0..1$ is derived as follows.

$$f = \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} dc_{00}^r & dc_{01}^r \\ dc_{10}^r & dc_{11}^r \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad (8-440)$$

Scaling of the elements f_{ij} of f is performed as follows.

$$c_{00}(j * 2 + i) = ((f_{ij} * \text{LevelScale}(QS_C \% 6, 0, 0)) << (QS_C / 6)) >> 5 \text{ with } i, j = 0, 1 \quad (8-441)$$

8.6.2 SP and SI slice decoding process for switching pictures

This process is invoked, when decoding P macroblock types in SP slices in which $sp_for_switch_flag$ is equal to 1 and when decoding SI macroblock type in SI slices.

Inputs to this process are the prediction residual transform coefficient levels and the prediction sample arrays $pred_L$, $pred_{Cb}$ and $pred_{Cr}$ for the current macroblock.

8.6.2.1 Luma transform coefficient decoding process

Inputs to this process are prediction luma samples pred_L and the luma prediction residual transform coefficient levels, LumaLevel .

The 4x4 array p with elements p_{ij} with $i, j = 0..3$ is derived as in subclause 8.6.1.1, is transformed according to Equation 8-423 to produce transform coefficients c^p . These transform coefficients are then quantised with the quantisation parameter QS_Y , as follows:

$$c_{ij}^s = \text{Sign}(c_{ij}^p) * ((\text{Abs}(c_{ij}^p) * \text{LevelScale2}(QS_Y \% 6, i, j) + (1 << (14 + QS_Y / 6))) >> (15 + QS_Y / 6)) \quad \text{with } i, j = 0..3 \quad (8-442)$$

The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with $\text{LumaLevel}[\text{luma4x4BlkIdx}]$ as the input and the two-dimensional array c^r with elements c_{ij}^r as the output.

The 4x4 array c with elements c_{ij} with $i, j = 0..3$ is derived as follows.

$$c_{ij} = c_{ij}^r + c_{ij}^s \quad \text{with } i, j = 0..3 \quad (8-443)$$

The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with c as the input and r as the output.

The 4x4 array u with elements u_{ij} is derived as follows.

$$u_{ij} = \text{Clip1}_Y(r_{ij}) \quad \text{with } i, j = 0..3 \quad (8-444)$$

The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with luma4x4BlkIdx and u as the inputs.

8.6.2.2 Chroma transform coefficient decoding process

Inputs to this process are predicted chroma samples for the current macroblock from subclause 8.4 and the prediction residual transform coefficient levels, ChromaDCLevel and ChromaACLevel .

This process is invoked twice: once for the Cb component and once for the Cr component. The component is referred to by replacing C with Cb for the Cb component and C with Cr for the Cr component. Let $iCbCr$ select the current chroma component.

For each 4x4 block of the current chroma component indexed using chroma4x4BlkIdx with chroma4x4BlkIdx equal to 0..3, the following applies.

1. The 4x4 array p with elements p_{ij} with $i, j = 0..3$ is derived as in subclause 8.6.1.2, is transformed according to Equation 8-423 to produce transform coefficients $c^p(\text{chroma4x4BlkIdx})$. These transform coefficients are then quantised with the quantisation parameter QS_C , with $i, j = 0..3$ except for the combination $i = 0, j = 0$ as follows. The processing of $c_{00}^p(\text{chroma4x4BlkIdx})$ is described below in this subclause.

$$c_{ij}^s = (\text{Sign}(c_{ij}^p(\text{chroma4x4BlkIdx})) * (\text{Abs}(c_{ij}^p(\text{chroma4x4BlkIdx})) * \text{LevelScale2}(QS_C \% 6, i, j) + (1 << (14 + QS_C / 6))) >> (15 + QS_C / 6)) \quad (8-445)$$

- The variable chromaList , which is a list of 16 entries, is derived. $\text{chromaList}[0]$ is set equal to 0. $\text{chromaList}[k]$ with index $k = 1..15$ are specified as follows.

$$\text{chromaList}[k] = \text{ChromaACLevel}[iCbCr][\text{chroma4x4BlkIdx}][k - 1] \quad (8-446)$$

- The inverse transform coefficient scanning process as described in subclause 8.5.5 is invoked with chromaList as the input and the two-dimensional array $c^r(\text{chroma4x4BlkIdx})$ with elements $c_{ij}^r(\text{chroma4x4BlkIdx})$ as the output.
- The 4x4 array $c(\text{chroma4x4BlkIdx})$ with elements $c_{ij}(\text{chroma4x4BlkIdx})$ with $i, j = 0..3$ except for the combination $i = 0, j = 0$ is derived as follows. The derivation of $c_{00}(\text{chroma4x4BlkIdx})$ is described below.

$$c_{ij}(\text{chroma4x4BlkIdx}) = c_{ij}^r(\text{chroma4x4BlkIdx}) + c_{ij}^s \quad (8-447)$$

- The scaling and transformation process for residual 4x4 blocks as specified in subclause 8.5.10 is invoked with $c(\text{chroma4x4BlkIdx})$ as the input and r as the output.

- The 4x4 array u with elements u_{ij} is derived as follows.

$$u_{ij} = \text{Clip1}_C(r_{ij}) \text{ with } i, j = 0..3 \quad (8-448)$$

- The picture construction process prior to deblocking filter process in subclause 8.5.12 is invoked with chroma4x4BlkIdx and u as the inputs.

The derivation of the DC transform coefficient level $c_{00}(\text{chroma4x4BlkIdx})$ is specified as follows. The DC transform coefficients of the 4 prediction 4x4 chroma blocks of the current component of the macroblock, $c_{00}^p(\text{chroma4x4BlkIdx})$, are assembled into a 2x2 matrix, and a 2x2 transform is applied to the DC transform coefficients of these blocks according to Equation 8-437 resulting in DC transform coefficients dc_{ij}^p .

These DC transform coefficients are then quantised with the quantisation parameter Q_{SC} , as given by:

$$dc_{ij}^s = (\text{Sign}(dc_{ij}^p) * (\text{Abs}(dc_{ij}^p) * \text{LevelScale2}(Q_{SC} \% 6, 0, 0) + (1 << (15 + Q_{SC} / 6)))) >> (16 + Q_{SC} / 6) \text{ with } i, j = 0, 1 \quad (8-449)$$

The parsed chroma DC prediction residual transform coefficients, $\text{ChromaDCLevel}[iCbCr][k]$ with $k = 0..3$ are added to these quantised DC transform coefficients of the prediction block, as given by:

$$dc_{ij}^r = dc_{ij}^s + \text{ChromaDCLevel}[iCbCr][j * 2 + i] \text{ with } i, j = 0, 1 \quad (8-450)$$

The 2x2 array f with elements f_{ij} and $i, j = 0..1$ is derived using Equation 8-440.

The 2x2 array f with elements f_{ij} and $i, j = 0..1$ is copied as follows.

$$c_{00}(j * 2 + i) = f_{ij} \text{ with } i, j = 0, 1 \quad (8-451)$$

8.7 Deblocking filter process

A conditional filtering shall be applied to all NxN (where $N = 4$ or $N = 8$ for luma, and $N = 4$ for chroma) block edges of a picture, except edges at the boundary of the picture and any edges for which the deblocking filter process is disabled by $\text{disable_deblocking_filter_idc}$, as specified below. This filtering process is performed on a macroblock basis after the completion of the picture construction process prior to deblocking filter process (as specified in subclauses 8.5 and 8.6) for the entire decoded picture, with all macroblocks in a picture processed in order of increasing macroblock addresses.

NOTE – Prior to the operation of the deblocking filter process for each macroblock, the deblocked samples of the macroblock or macroblock pair above (if any) and the macroblock or macroblock pair to the left (if any) of the current macroblock are always available because the deblocking filter process is performed after the completion of the picture construction process prior to deblocking filter process for the entire decoded picture. However, for purposes of determining which edges are to be filtered when $\text{disable_deblocking_filter_idc}$ is equal to 2, macroblocks in different slices are considered not available during specified steps of the operation of the deblocking filter process.

The deblocking filter process is invoked for the luma and chroma components separately. For each macroblock and each component, vertical edges are filtered first, starting with the edge on the left-hand side of the macroblock proceeding through the edges towards the right-hand side of the macroblock in their geometrical order, and then horizontal edges are filtered, starting with the edge on the top of the macroblock proceeding through the edges towards the bottom of the macroblock in their geometrical order. Figure 8-10 shows edges of a macroblock which can be interpreted as luma or chroma edges.

When interpreting the edges in Figure 8-10 as luma edges, depending on the $\text{transform_size_8x8_flag}$, the following applies.

- If $\text{transform_size_8x8_flag}$ is equal to 0, both types, the solid bold and dashed bold luma edges are filtered.
- Otherwise ($\text{transform_size_8x8_flag}$ is equal to 1), only the solid bold luma edges are filtered.

When interpreting the edges in Figure 8-10 as chroma edges, depending on chroma_format_idc , the following applies.

- If chroma_format_idc is equal to 1 (4:2:0 format), only the solid bold chroma edges are filtered.
- Otherwise, if chroma_format_idc is equal to 2 (4:2:2 format), the solid bold vertical chroma edges are filtered and both types, the solid bold and dashed bold horizontal chroma edges are filtered
- Otherwise, if chroma_format_idc is equal to 3 (4:4:4 format), both types, the solid bold and dashed bold chroma edges are filtered.
- Otherwise (chroma_format_idc is equal to 0 (monochrome)), no chroma edges are filtered.

Figure 8-10 – Boundaries in a macroblock to be filtered

For the current macroblock address CurrMbAddr proceeding over values $0..PicSizeInMbs - 1$, the following applies.

1. The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to mbAddrA and mbAddrB.
2. The variables fieldModeMbFlag, filterInternalEdgesFlag, filterLeftMbEdgeFlag and filterTopMbEdgeFlag are derived as follows.
 - The variable fieldModeMbFlag is derived as follows.
 - If any of the following conditions is true, fieldModeMbFlag is set equal to 1.
 - field_pic_flag is equal to 1
 - MbaffFrameFlag is equal to 1 and the macroblock CurrMbAddr is a field macroblock
 - Otherwise, fieldModeMbFlag is set equal to 0.
 - The variable filterInternalEdgesFlag is derived as follows.
 - If disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is equal to 1, the variable filterInternalEdgesFlag is set equal to 0;
 - Otherwise (disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is not equal to 1), the variable filterInternalEdgesFlag is set equal to 1.
 - The variable filterLeftMbEdgeFlag is derived as follows.
 - If any of the following conditions is true, the variable filterLeftMbEdgeFlag is set equal to 0.
 - MbaffFrameFlag is equal to 0 and CurrMbAddr % PicWidthInMbs is equal to 0.
 - MbaffFrameFlag is equal to 1 and $(CurrMbAddr \gg 1) \% PicWidthInMbs$ is equal to 0
 - disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is equal to 1
 - disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is equal to 2 and the macroblock mbAddrA is not available
 - Otherwise, the variable filterLeftMbEdgeFlag is set equal to 1.
 - The variable filterTopMbEdgeFlag is derived as follows.
 - If any of the following conditions is true, the variable filterTopMbEdgeFlag is set equal to 0.
 - MbaffFrameFlag is equal to 0 and CurrMbAddr is less than PicWidthInMbs.
 - MbaffFrameFlag is equal to 1, $(CurrMbAddr \gg 1)$ is less than PicWidthInMbs, and the macroblock CurrMbAddr is a field macroblock.

- MbaffFrameFlag is equal to 1, (CurrMbAddr >> 1) is less than PicWidthInMbs, the macroblock CurrMbAddr is a frame macroblock, and CurrMbAddr % 2 is equal to 0.
 - disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is equal to 1
 - disable_deblocking_filter_idc for the slice that contains the macroblock CurrMbAddr is equal to 2 and the macroblock mbAddrB is not available
 - Otherwise, the variable filterTopMbEdgeFlag is set equal to 1.
3. Given the variables fieldModeMbFlag, filterInternalEdgesFlag, filterLeftMbEdgeFlag and filterTopMbEdgeFlag the deblocking filtering is controlled as follows.
- When filterLeftMbEdgeFlag is equal to 1, the filtering of the left vertical luma edge is specified as follows.
 - The process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 1, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (0, k)$ with $k = 0..15$ as input and S'_L as output.
 - When filterInternalEdgesFlag is equal to 1, the filtering of the internal vertical luma edges is specified as follows.
 - When transform_size_8x8_flag is equal to 0, the process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 1, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (4, k)$ with $k = 0..15$ as input and S'_L as output.
 - The process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 1, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (8, k)$ with $k = 0..15$ as input and S'_L as output.
 - When transform_size_8x8_flag is equal to 0, the process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 1, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (12, k)$ with $k = 0..15$ as input and S'_L as output.
 - When filterTopMbEdgeFlag is equal to 1, the filtering of the top horizontal luma edge is specified as follows.
 - If MbaffFrameFlag is equal to 1, (CurrMbAddr % 2) is equal to 0, CurrMbAddr is greater than or equal to $2 * \text{PicWidthInMbs}$, the macroblock CurrMbAddr is a frame macroblock, and the macroblock $(\text{CurrMbAddr} - 2 * \text{PicWidthInMbs} + 1)$ is a field macroblock, the following applies.
 - The process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = 1, and $(x_{E_k}, y_{E_k}) = (k, 0)$ with $k = 0..15$ as input and S'_L as output.
 - The process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = 1, and $(x_{E_k}, y_{E_k}) = (k, 1)$ with $k = 0..15$ as input and S'_L as output.
 - Otherwise, the process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (k, 0)$ with $k = 0..15$ as input and S'_L as output.
 - When filterInternalEdgesFlag is equal to 1, the filtering of the internal horizontal luma edges is specified as follows.
 - When transform_size_8x8_flag is equal to 0, the process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (k, 4)$ with $k = 0..15$ as input and S'_L as output.
 - The process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (k, 8)$ with $k = 0..15$ as input and S'_L as output.
 - When transform_size_8x8_flag is equal to 0, the process specified in subclause 8.7.1 is invoked with chromaEdgeFlag = 0, verticalEdgeFlag = 0, fieldModeFilteringFlag = fieldModeMbFlag, and $(x_{E_k}, y_{E_k}) = (k, 12)$ with $k = 0..15$ as input and S'_L as output.

- For the filtering of both chroma components with $iCbCr = 0$ for Cb and $iCbCr = 1$ for Cr, the following applies.
 - When $filterLeftMbEdgeFlag$ is equal to 1, the filtering of the left vertical chroma edge is specified as follows.
 - The process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 1$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (0, k)$ with $k = 0..MbHeightC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $filterInternalEdgesFlag$ is equal to 1, the filtering of the internal vertical chroma edge is specified as follows.
 - The process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 1$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (4, k)$ with $k = 0..MbHeightC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $chroma_format_idc$ is equal to 3, the process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 1$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (8, k)$ with $k = 0..MbHeightC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $chroma_format_idc$ is equal to 3, the process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 1$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (12, k)$ with $k = 0..MbHeightC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $filterTopMbEdgeFlag$ is equal to 1, the filtering of the top horizontal chroma edge is specified as follows.
 - If $MbaffFrameFlag$ is equal to 1, $(CurrMbAddr \% 2)$ is equal to 0, $CurrMbAddr$ is greater than or equal to $2 * PicWidthInMbs$, the macroblock $CurrMbAddr$ is a frame macroblock, and the macroblock $(CurrMbAddr - 2 * PicWidthInMbs + 1)$ is a field macroblock, the following applies.
 - The process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 0$, $fieldModeFilteringFlag = 1$, and $(xE_k, yE_k) = (k, 0)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - The process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 0$, $fieldModeFilteringFlag = 1$, and $(xE_k, yE_k) = (k, 1)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - Otherwise, the process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 0$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (k, 0)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $filterInternalEdgesFlag$ is equal to 1, the filtering of the internal horizontal chroma edge is specified as follows.
 - The process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 0$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (k, 4)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.
 - When $chroma_format_idc$ is not equal to 1, the process specified in subclause 8.7.1 is invoked with $chromaEdgeFlag = 1$, $iCbCr$, $verticalEdgeFlag = 0$, $fieldModeFilteringFlag = fieldModeMbFlag$, and $(xE_k, yE_k) = (k, 8)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for $iCbCr = 0$ and C being replaced by Cr for $iCbCr = 1$ as output.

- When `chroma_format_idc` is not equal to 1, the process specified in subclause 8.7.1 is invoked with `chromaEdgeFlag = 1`, `iCbCr`, `verticalEdgeFlag = 0`, `fieldModeFilteringFlag = fieldModeMbFlag`, and $(xE_k, yE_k) = (k, 12)$ with $k = 0..MbWidthC - 1$ as input and S'_C with C being replaced by Cb for `iCbCr = 0` and C being replaced by Cr for `iCbCr = 1` as output.

NOTE – When field mode filtering (`fieldModeFilteringFlag` is equal to 1) is applied across the top horizontal edges of a frame macroblock, this vertical filtering across the top or bottom macroblock boundary may involve some samples that extend across an internal block edge that is also filtered internally in frame mode.

NOTE – For example, in 4:2:0 chroma format when `transform_size_8x8_flag` is equal to 0, the following applies. 3 horizontal luma edges, 1 horizontal chroma edge for Cb , and 1 horizontal chroma edge for Cr are filtered that are internal to a macroblock. When field mode filtering (`fieldModeFilteringFlag` is equal to 1) is applied to the top edges of a frame macroblock, 2 horizontal luma, 2 horizontal chroma edges for Cb , and 2 horizontal chroma edges for Cr between the frame macroblock and the above macroblock pair are filtered using field mode filtering, for a total of up to 5 horizontal luma edges, 3 horizontal chroma edges for Cb , and 3 horizontal chroma edges for Cr filtered that are considered to be controlled by the frame macroblock. In all other cases, at most 4 horizontal luma, 2 horizontal chroma edges for Cb , and 2 horizontal chroma edges for Cr are filtered that are considered to be controlled by a particular macroblock.

Finally, the arrays S'_L , S'_{Cb} , S'_{Cr} are assigned to the arrays S_L , S_{Cb} , S_{Cr} (which represent the decoded picture), respectively.

8.7.1 Filtering process for block edges

Inputs to this process are `chromaEdgeFlag`, the chroma component index `iCbCr` (when `chromaEdgeFlag` is equal to 1), `verticalEdgeFlag`, `fieldModeFilteringFlag`, and a set of nE sample locations (xE_k, yE_k) , with $k = 0..nE - 1$, expressed relative to the upper left corner of the macroblock `CurrMbAddr`. The set of sample locations (xE_k, yE_k) represent the sample locations immediately to the right of a vertical edge (when `verticalEdgeFlag` is equal to 1) or immediately below a horizontal edge (when `verticalEdgeFlag` is equal to 0).

The variable nE is derived as follows.

- If `chromaEdgeFlag` is equal to 0, nE is set equal to 16.
- Otherwise (`chromaEdgeFlag` is equal to 1), nE is set equal to $(verticalEdgeFlag == 1) ? MbHeightC : MbWidthC$.

Let s' be a variable specifying a luma or chroma sample array, be derived as follows.

- If `chromaEdgeFlag` is equal to 0, s' represents the luma sample array S'_L of the current picture.
- Otherwise, if `chromaEdgeFlag` is equal to 1 and `iCbCr` is equal to 0, s' represents the chroma sample array S'_{Cb} of the chroma component Cb of the current picture.
- Otherwise (`chromaEdgeFlag` is equal to 1 and `iCbCr` is equal to 1), s' represents the chroma sample array S'_{Cr} of the chroma component Cr of the current picture.

The variable dy is derived as follows.

- If `fieldModeFilteringFlag` is equal to 1 and `MbaffFrameFlag` is equal to 1, dy is set equal to 2.
- Otherwise (`fieldModeFilteringFlag` is equal to 0 or `MbaffFrameFlag` is equal to 0), dy is set equal to 1.

The position of the upper-left luma sample of the macroblock `CurrMbAddr` is derived by invoking the inverse macroblock scanning process in subclause 6.4.1 with `mbAddr = CurrMbAddr` as input and the output being assigned to (xI, yI) .

The variables xP and yP are derived as follows.

- If `chromaEdgeFlag` is equal to 0, xP is set equal to xI and yP is set equal to yI .
- Otherwise (`chromaEdgeFlag` is equal to 1), xP is set equal to $xI / SubWidthC$ and yP is set equal to $(yI + SubHeightC - 1) / SubHeightC$.

Figure 8-11 – Convention for describing samples across a 4x4 block horizontal or vertical boundary

For each sample location (x_{E_k} , y_{E_k}), $k = 0 \dots n_E - 1$, the following applies.

- The filtering process is applied to a set of eight samples across a 4x4 block horizontal or vertical edge denoted as p_i and q_i with $i = 0..3$ as shown in Figure 8-11 with the edge lying between p_0 and q_0 . p_i and q_i with $i = 0..3$ are specified as follows.

- If verticalEdgeFlag is equal to 1,

$$q_i = s'[xP + x_{E_k} + i, yP + dy * y_{E_k}] \quad (8-452)$$

$$p_i = s'[xP + x_{E_k} - i - 1, yP + dy * y_{E_k}] \quad (8-453)$$

- Otherwise (verticalEdgeFlag is equal to 0),

$$q_i = s'[xP + x_{E_k}, yP + dy * (y_{E_k} + i) - (y_{E_k} \% 2)] \quad (8-454)$$

$$p_i = s'[xP + x_{E_k}, yP + dy * (y_{E_k} - i - 1) - (y_{E_k} \% 2)] \quad (8-455)$$

- The process specified in subclause 8.7.2 is invoked with the sample values p_i and q_i ($i = 0..3$), chromaEdgeFlag, verticalEdgeFlag, and fieldModeFilteringFlag as input, and the output is assigned to the filtered result sample values p'_i and q'_i with $i = 0..2$.

- The input sample values p_i and q_i with $i = 0..2$ are replaced by the corresponding filtered result sample values p'_i and q'_i with $i = 0..2$ inside the sample array s' as follows.

- If verticalEdgeFlag is equal to 1,

$$s'[xP + x_{E_k} + i, yP + dy * y_{E_k}] = q'_i \quad (8-456)$$

$$s'[xP + x_{E_k} - i - 1, yP + dy * y_{E_k}] = p'_i \quad (8-457)$$

- Otherwise (verticalEdgeFlag is equal to 0),

$$s'[xP + x_{E_k}, yP + dy * (y_{E_k} + i) - (y_{E_k} \% 2)] = q'_i \quad (8-458)$$

$$s'[xP + x_{E_k}, yP + dy * (y_{E_k} - i - 1) - (y_{E_k} \% 2)] = p'_i \quad (8-459)$$

8.7.2 Filtering process for a set of samples across a horizontal or vertical block edge

Inputs to this process are the input sample values p_i and q_i with i in the range of 0..3 of a single set of samples across an edge that is to be filtered, chromaEdgeFlag, verticalEdgeFlag, and fieldModeFilteringFlag.

Outputs of this process are the filtered result sample values p'_i and q'_i with i in the range of 0..2.

The content dependent boundary filtering strength variable bS is derived as follows.

- If chromaEdgeFlag is equal to 0, the derivation process for the content dependent boundary filtering strength specified in subclause 8.7.2.1 is invoked with p_0 , q_0 , and verticalEdgeFlag as input, and the output is assigned to bS .
- Otherwise (chromaEdgeFlag is equal to 1), the bS used for filtering a set of samples of a horizontal or vertical chroma edge shall be set equal to the value of bS for filtering the set of samples of a horizontal or vertical luma edge, respectively, that contains the luma sample at location ($\text{SubWidthC} * x$, $\text{SubHeightC} * y$) inside the luma array of the same field, where (x , y) is the location of the chroma sample q_0 inside the chroma array for that field.

The process specified in subclause 8.7.2.2 is invoked with p_0 , q_0 , p_1 , q_1 , chromaEdgeFlag, and bS as input, and the output is assigned to filterSamplesFlag, indexA, α , and β .

Depending on the variable filterSamplesFlag, the following applies.

- If filterSamplesFlag is equal to 1, the following applies.
 - If bS is less than 4, the process specified in subclause 8.7.2.3 is invoked with p_i and q_i ($i = 0..2$), chromaEdgeFlag, bS, β , and indexA given as input, and the output is assigned to p'_i and q'_i ($i = 0..2$).
 - Otherwise (bS is equal to 4), the process specified in subclause 8.7.2.4 is invoked with p_i and q_i ($i = 0..3$), chromaEdgeFlag, α , and β given as input, and the output is assigned to p'_i and q'_i ($i = 0..2$).
- Otherwise (filterSamplesFlag is equal to 0), the filtered result samples p'_i and q'_i ($i = 0..2$) are replaced by the corresponding input samples p_i and q_i :

$$\text{for } i = 0..2, \quad p'_i = p_i \quad (8-460)$$

$$\text{for } i = 0..2, \quad q'_i = q_i \quad (8-461)$$

8.7.2.1 Derivation process for the luma content dependent boundary filtering strength

Inputs to this process are the input sample values p_0 and q_0 of a single set of samples across an edge that is to be filtered and verticalEdgeFlag.

Output of this process is the variable bS.

Let the variable mixedModeEdgeFlag be derived as follows.

- If MbaffFrameFlag is equal to 1 and the samples p_0 and q_0 are in different macroblock pairs, one of which is a field macroblock pair and the other is a frame macroblock pair, mixedModeEdgeFlag is set equal to 1
- Otherwise, mixedModeEdgeFlag is set equal to 0.

The variable bS is derived as follows.

- If the block edge is also a macroblock edge and any of the following conditions are true, a value of bS equal to 4 shall be the output:
 - the samples p_0 and q_0 are both in frame macroblocks and either or both of the samples p_0 or q_0 is in a macroblock coded using an Intra macroblock prediction mode
 - the samples p_0 and q_0 are both in frame macroblocks and either or both of the samples p_0 or q_0 is in a macroblock that is in a slice with slice_type equal to SP or SI
 - MbaffFrameFlag is equal to 1 or field_pic_flag is equal to 1, and verticalEdgeFlag is equal to 1, and either or both of the samples p_0 or q_0 is in a macroblock coded using an Intra macroblock prediction mode.
 - MbaffFrameFlag is equal to 1 or field_pic_flag is equal to 1, and verticalEdgeFlag is equal to 1, and either or both of the samples p_0 or q_0 is in a macroblock that is in a slice with slice_type equal to SP or SI
- Otherwise, if any of the following conditions are true, a value of bS equal to 3 shall be the output:
 - mixedModeEdgeFlag is equal to 0 and either or both of the samples p_0 or q_0 is in a macroblock coded using an Intra macroblock prediction mode
 - mixedModeEdgeFlag is equal to 0 and either or both of the samples p_0 or q_0 is in a macroblock that is in a slice with slice_type equal to SP or SI
 - mixedModeEdgeFlag is equal to 1, verticalEdgeFlag is equal to 0, and either or both of the samples p_0 or q_0 is in a macroblock coded using an Intra macroblock prediction mode
 - mixedModeEdgeFlag is equal to 1, verticalEdgeFlag is equal to 0, and either or both of the samples p_0 or q_0 is in a macroblock that is in a slice with slice_type equal to SP or SI
- Otherwise, if the following condition is true, a value of bS equal to 2 shall be the output:
 - the luma block containing sample p_0 or the luma block containing sample q_0 contains non-zero transform coefficient levels
- Otherwise, if any of the following conditions are true, a value of bS equal to 1 shall be the output:
 - mixedModeEdgeFlag is equal to 1

- mixedModeEdgeFlag is equal to 0 and for the prediction of the macroblock/sub-macroblock partition containing the sample p_0 different reference pictures or a different number of motion vectors are used than for the prediction of the macroblock/sub-macroblock partition containing the sample q_0 .

NOTE – The determination of whether the reference pictures used for the two macroblock/sub-macroblock partitions are the same or different is based only on which pictures are referenced, without regard to whether a prediction is formed using an index into reference picture list 0 or an index into reference picture list 1, and also without regard to whether or not the index position within a reference picture list is different or not.

- mixedModeEdgeFlag is equal to 0 and one motion vector is used to predict the macroblock/sub-macroblock partition containing the sample p_0 and one motion vector is used to predict the macroblock/sub-macroblock partition containing the sample q_0 and the absolute difference between the horizontal or vertical component of the motion vectors used is greater than or equal to 4 in units of quarter luma frame samples.
- mixedModeEdgeFlag is equal to 0 and two motion vectors and two different reference pictures are used to predict the macroblock/sub-macroblock partition containing the sample p_0 and two motion vectors for the same two reference pictures are used to predict the macroblock/sub-macroblock partition containing the sample q_0 and the absolute difference between the horizontal or vertical component of the two motion vectors used in the prediction of the two macroblock/sub-macroblock partitions for the same reference picture is greater than or equal to 4 in units of quarter luma frame samples.
- mixedModeEdgeFlag is equal to 0 and two motion vectors for the same reference picture are used to predict the macroblock/sub-macroblock partition containing the sample p_0 and two motion vectors for the same reference picture are used to predict the macroblock/sub-macroblock partition containing the sample q_0 and both of the following conditions are true:
 - The absolute difference between the horizontal or vertical component of list 0 motion vectors used in the prediction of the two macroblock/sub-macroblock partitions is greater than or equal to 4 in quarter luma frame samples or the absolute difference between the horizontal or vertical component of the list 1 motion vectors used in the prediction of the two macroblock/sub-macroblock partitions is greater than or equal to 4 in units of quarter luma frame samples.
 - The absolute difference between the horizontal or vertical component of list 0 motion vector used in the prediction of the macroblock/sub-macroblock partition containing the sample p_0 and the list 1 motion vector used in the prediction of the macroblock/sub-macroblock partition containing the sample q_0 is greater than or equal to 4 in units of quarter luma frame samples or the absolute difference between the horizontal or vertical component of the list 1 motion vector used in the prediction of the macroblock/sub-macroblock partition containing the sample p_0 and list 0 motion vector used in the prediction of the macroblock/sub-macroblock partition containing the sample q_0 is greater than or equal to 4 in units of quarter luma frame samples.

NOTE – A vertical difference of 4 in units of quarter luma frame samples is a difference of 2 in units of quarter luma field samples

- Otherwise, a value of bS equal to 0 shall be the output.

8.7.2.2 Derivation process for the thresholds for each block edge

Inputs to this process are the input sample values p_0 , q_0 , p_1 and q_1 of a single set of samples across an edge that is to be filtered, chromaEdgeFlag, and bS, for the set of input samples, as specified in 8.7.2.

Outputs of this process are the variable filterSamplesFlag, which indicates whether the input samples are filtered, the value of indexA, and the values of the threshold variables α and β .

Let qP_p and qP_q be variables specifying quantisation parameter values for the macroblocks containing the samples p_0 and q_0 , respectively. The variables qP_z (with z being replaced by p or q) are derived as follows.

- If chromaEdgeFlag is equal to 0, the following applies.
 - If the macroblock containing the sample z_0 is an I_PCM macroblock, qP_z is set to 0.
 - Otherwise (the macroblock containing the sample z_0 is not an I_PCM macroblock), qP_z is set to the value of QP_Y of the macroblock containing the sample z_0 .
- Otherwise (chromaEdgeFlag is equal to 1), the following applies.
 - If the macroblock containing the sample z_0 is an I_PCM macroblock, qP_z is set to the value of QP_C that corresponds to a value of 0 for QP_Y as specified in subclause 8.5.7.

- Otherwise (the macroblock containing the sample z_0 is not an I_PCM macroblock), qP_z is set to the value of QP_C that corresponds to the value QP_Y of the macroblock containing the sample z_0 as specified in subclause 8.5.7.

Let qP_{av} be a variable specifying an average quantisation parameter. It is derived as follows.

$$qP_{av} = (qP_p + qP_q + 1) \gg 1 \quad (8-462)$$

NOTE - In SP and SI slices, qP_{av} is derived in the same way as in other slice types. QS_Y from Equation 7-28 is not used in the deblocking filter.

Let indexA be a variable that is used to access the α table (Table 8-16) as well as the t_{C0} table (Table 8-17), which is used in filtering of edges with bS less than 4 as specified in subclause 8.7.2.3, and let indexB be a variable that is used to access the β table (Table 8-16). The variables indexA and indexB are derived as follows, where the values of FilterOffsetA and FilterOffsetB are the values of those variables specified in subclause 7.4.3 for the slice that contains the macroblock containing sample q_0 .

$$\text{indexA} = \text{Clip3}(0, 51, qP_{av} + \text{FilterOffsetA}) \quad (8-463)$$

$$\text{indexB} = \text{Clip3}(0, 51, qP_{av} + \text{FilterOffsetB}) \quad (8-464)$$

The variables α' and β' depending on the values of indexA and indexB are specified in Table 8-16. Depending on chromaEdgeFlag, the corresponding threshold variables α and β are derived as follows.

- If chromaEdgeFlag is equal to 0,

$$\alpha = \alpha' * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-465)$$

$$\beta = \beta' * (1 \ll (\text{BitDepth}_Y - 8)) \quad (8-466)$$

- Otherwise (chromaEdgeFlag is equal to 1),

$$\alpha = \alpha' * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-467)$$

$$\beta = \beta' * (1 \ll (\text{BitDepth}_C - 8)) \quad (8-468)$$

The variable filterSamplesFlag is derived by

$$\text{filterSamplesFlag} = (bS \neq 0 \ \&\& \ \text{Abs}(p_0 - q_0) < \alpha \ \&\& \ \text{Abs}(p_1 - p_0) < \beta \ \&\& \ \text{Abs}(q_1 - q_0) < \beta) \quad (8-469)$$

8.7.2.3 Filtering process for edges with bS less than 4

Inputs to this process are the input sample values p_i and q_i ($i = 0..2$) of a single set of samples across an edge that is to be filtered, chromaEdgeFlag, bS, β , and indexA, for the set of input samples, as specified in 8.7.2.

Outputs of this process are the filtered result sample values p'_i and q'_i ($i = 0..2$) for the set of input sample values.

The filtered result samples p'_0 and q'_0 are derived by

$$\Delta = \text{Clip3}(-t_c, t_c, (((q_0 - p_0) << 2) + (p_1 - q_1) + 4) >> 3)) \quad (8-470)$$

$$p'_0 = \text{Clip1}(p_0 + \Delta) \quad (8-471)$$

$$q'_0 = \text{Clip1}(q_0 - \Delta) \quad (8-472)$$

where the threshold t_c is determined as follows.

- If chromaEdgeFlag is equal to 0,

$$t_c = t_{c0} + ((a_p < \beta) ? 1 : 0) + ((a_q < \beta) ? 1 : 0) \quad (8-473)$$

- Otherwise (chromaEdgeFlag is equal to 1),

$$t_c = t_{c0} + 1 \quad (8-474)$$

Depending on the values of indexA and bS the variable t'_{c0} is specified in Table 8-17. Depending on chromaEdgeFlag, the corresponding threshold variable t_{c0} is derived as follows.

- If chromaEdgeFlag is equal to 0,

$$t_{c0} = t'_{c0} * (1 << (\text{BitDepth}_Y - 8)) \quad (8-475)$$

- Otherwise (chromaEdgeFlag is equal to 1),

$$t_{c0} = t'_{c0} * (1 << (\text{BitDepth}_C - 8)) \quad (8-476)$$

Let a_p and a_q be two threshold variables specified by

$$a_p = \text{Abs}(p_2 - p_0) \quad (8-477)$$

$$a_q = \text{Abs}(q_2 - q_0) \quad (8-478)$$

The filtered result sample p'_1 is derived as follows

- If chromaEdgeFlag is equal to 0 and a_p is less than β ,

$$p'_1 = p_1 + \text{Clip3}(-t_{c0}, t_{c0}, (p_2 + ((p_0 + q_0 + 1) >> 1) - (p_1 << 1)) >> 1) \quad (8-479)$$

- Otherwise (chromaEdgeFlag is equal to 1 or a_p is greater than or equal to β),

$$p'_1 = p_1 \quad (8-480)$$

The filtered result sample q'_1 is derived as follows

- If chromaEdgeFlag is equal to 0 and a_q is less than β ,

$$q'_1 = q_1 + \text{Clip3}(-t_{c0}, t_{c0}, (q_2 + ((p_0 + q_0 + 1) >> 1) - (q_1 << 1)) >> 1) \quad (8-481)$$

- Otherwise (chromaEdgeFlag is equal to 1 or a_q is greater than or equal to β),

$$q'_1 = q_1 \quad (8-482)$$

The filtered result samples p'_2 and q'_2 are always set equal to the input samples p_2 and q_2 :

$$p'_2 = p_2 \quad (8-483)$$

$$q'_2 = q_2 \quad (8-484)$$

8.7.2.4 Filtering process for edges for bS equal to 4

Inputs to this process are the input sample values p_i and q_i ($i = 0..3$) of a single set of samples across an edge that is to be filtered, the variable chromaEdgeFlag, and the values of the threshold variables α and β for the set of samples, as specified in subclause 8.7.2.

Outputs of this process are the filtered result sample values p'_i and q'_i ($i = 0..2$) for the set of input sample values.

Let a_p and a_q be two threshold variables as specified in Equations 8-477 and 8-478, respectively, in subclause 8.7.2.3.

The filtered result samples p'_i ($i = 0..2$) are derived as follows.

- If chromaEdgeFlag is equal to 0 and the following condition holds,

$$a_p < \beta \ \&\& \ \text{Abs}(p_0 - q_0) < ((\alpha >> 2) + 2) \quad (8-485)$$

then the variables p'_0 , p'_1 , and p'_2 are derived by

$$p'_0 = (p_2 + 2*p_1 + 2*p_0 + 2*q_0 + q_1 + 4) >> 3 \quad (8-486)$$

$$p'_1 = (p_2 + p_1 + p_0 + q_0 + 2) >> 2 \quad (8-487)$$

$$p'_2 = (2*p_3 + 3*p_2 + p_1 + p_0 + q_0 + 4) >> 3 \quad (8-488)$$

- Otherwise (chromaEdgeFlag is equal to 1 or the condition in Equation 8-485 does not hold), the variables p'_0 , p'_1 , and p'_2 are derived by

$$p'_0 = (2*p_1 + p_0 + q_1 + 2) >> 2 \quad (8-489)$$

$$p'_1 = p_1 \quad (8-490)$$

$$p'_2 = p_2 \quad (8-491)$$

The filtered result samples q'_i ($i = 0..2$) are derived as follows.

- If chromaEdgeFlag is equal to 0 and the following condition holds,

$$a_q < \beta \ \&\& \ Abs(p_0 - q_0) < ((\alpha \gg 2) + 2) \quad (8-492)$$

then the variables q'_0 , q'_1 , and q'_2 are derived by

$$q'_0 = (p_1 + 2*p_0 + 2*q_0 + 2*q_1 + q_2 + 4) \gg 3 \quad (8-493)$$

$$q'_1 = (p_0 + q_0 + q_1 + q_2 + 2) \gg 2 \quad (8-494)$$

$$q'_2 = (2*q_3 + 3*q_2 + q_1 + q_0 + p_0 + 4) \gg 3 \quad (8-495)$$

- Otherwise (chromaEdgeFlag is equal to 1 or the condition in Equation 8-492 does not hold), the variables q'_0 , q'_1 , and q'_2 are derived by

$$q'_0 = (2*q_1 + q_0 + p_1 + 2) \gg 2 \quad (8-496)$$

$$q'_1 = q_1 \quad (8-497)$$

$$q'_2 = q_2 \quad (8-498)$$

9 Parsing process

Inputs to this process are bits from the RBSP.

Outputs of this process are syntax element values.

This process is invoked when the descriptor of a syntax element in the syntax tables in subclause 7.3 is equal to ue(v), me(v), se(v), te(v) (see subclause 9.1), ce(v) (see subclause 9.2), or ae(v) (see subclause 9.3).

9.1 Parsing process for Exp-Golomb codes

This process is invoked when the descriptor of a syntax element in the syntax tables in subclause 7.3 is equal to ue(v), me(v), se(v), or te(v). For syntax elements in subclauses 7.3.4 and 7.3.5, this process is invoked only when entropy_coding_mode_flag is equal to 0.

Inputs to this process are bits from the RBSP.

Outputs of this process are syntax element values.

Syntax elements coded as ue(v), me(v), or se(v) are Exp-Golomb-coded. Syntax elements coded as te(v) are truncated Exp-Golomb-coded. The parsing process for these syntax elements begins with reading the bits starting at the current location in the bitstream up to and including the first non-zero bit, and counting the number of leading bits that are equal to 0. This process shall be equivalent to the following:

```

leadingZeroBits = -1;
for( b = 0; !b; leadingZeroBits++ )
    b = read_bits( 1 )

```

The variable codeNum is then assigned as follows:

$$\text{codeNum} = 2^{\text{leadingZeroBits}} - 1 + \text{read_bits}(\text{leadingZeroBits})$$

where the value returned from read_bits(leadingZeroBits) is interpreted as a binary representation of an unsigned integer with most significant bit written first.

Table 9-1 illustrates the structure of the Exp-Golomb code by separating the bit string into “prefix” and “suffix” bits. The “prefix” bits are those bits that are parsed in the above pseudo-code for the computation of leadingZeroBits, and are shown as either 0 or 1 in the bit string column of Table 9-1. The “suffix” bits are those bits that are parsed in the computation of codeNum and are shown as x_i in Table 9-1, with i being in the range 0 to leadingZeroBits - 1, inclusive. Each x_i can take on values 0 or 1.

Table 9-1 – Bit strings with “prefix” and “suffix” bits and assignment to codeNum ranges (informative)

Bit string form	Range of codeNum
1	0
0 1 x_0	1-2
0 0 1 x_1 x_0	3-6
0 0 0 1 x_2 x_1 x_0	7-14
0 0 0 0 1 x_3 x_2 x_1 x_0	15-30
0 0 0 0 0 1 x_4 x_3 x_2 x_1 x_0	31-62
...	...

Table 9-2 illustrates explicitly the assignment of bit strings to codeNum values.

Table 9-2 – Exp-Golomb bit strings and codeNum in explicit form and used as ue(v) (informative)

Bit string	codeNum
1	0
0 1 0	1
0 1 1	2
0 0 1 0 0	3
0 0 1 0 1	4
0 0 1 1 0	5
0 0 1 1 1	6
0 0 0 1 0 0 0	7
0 0 0 1 0 0 1	8
0 0 0 1 0 1 0	9
...	...

Depending on the descriptor, the value of a syntax element is derived as follows.

- If the syntax element is coded as ue(v), the value of the syntax element is equal to codeNum.
- Otherwise, if the syntax element is coded as se(v), the value of the syntax element is derived by invoking the mapping process for signed Exp-Golomb codes as specified in subclause 9.1.1 with codeNum as the input.
- Otherwise, if the syntax element is coded as me(v), the value of the syntax element is derived by invoking the mapping process for coded block pattern as specified in subclause 9.1.2 with codeNum as the input.
- Otherwise (the syntax element is coded as te(v)), the range of the syntax element shall be determined first. The range of this syntax element may be between 0 and x, with x being greater than or equal to 1 and is used in the derivation of the value of a syntax element as follows
 - If x is greater than 1, codeNum and the value of the syntax element shall be derived in the same way as for syntax elements coded as ue(v)

- Otherwise (x is equal to 1), the parsing process for codeNum which is equal to the value of the syntax element is given by a process equivalent to:

```
b = read_bits( 1 )
codeNum = !b
```

9.1.1 Mapping process for signed Exp-Golomb codes

Input to this process is codeNum as specified in subclause 9.1.

Output of this process is a value of a syntax element coded as se(v).

The syntax element is assigned to the codeNum by ordering the syntax element by its absolute value in increasing order and representing the positive value for a given absolute value with the lower codeNum. Table 9-3 provides the assignment rule.

Table 9-3 – Assignment of syntax element to codeNum for signed Exp-Golomb coded syntax elements se(v)

codeNum	syntax element value
0	0
1	1
2	-1
3	2
4	-2
5	3
6	-3
k	$(-1)^{k+1} \text{Ceil}(k \div 2)$

9.1.2 Mapping process for coded block pattern

Input to this process is codeNum as specified in subclause 9.1.

Output of this process is a value of the syntax element coded_block_pattern coded as me(v).

Table 9-4 shows the assignment of coded_block_pattern to codeNum depending on whether the macroblock prediction mode is equal to Intra_4x4, Intra_8x8 or Inter.

Table 9-4 – Assignment of codeNum to values of coded_block_pattern for macroblock prediction modes

(a) chroma_format_idc is not equal to 0

9.2 CAVLC parsing process for transform coefficient levels

This process is invoked when parsing syntax elements with descriptor equal to ce(v) in subclause 7.3.5.3.1 and when entropy_coding_mode_flag is equal to 0.

Inputs to this process are bits from slice data, a maximum number of non-zero transform coefficient levels maxNumCoeff, the luma block index luma4x4BlkIdx or the chroma block index chroma4x4BlkIdx of the current block of transform coefficient levels.

Output of this process is the list coeffLevel containing transform coefficient levels of the luma block with block index luma4x4BlkIdx or the chroma block with block index chroma4x4BlkIdx.

The process is specified in the following ordered steps:

1. All transform coefficient levels, with indices from 0 to maxNumCoeff - 1, in the list coeffLevel are set equal to 0.
2. The total number of non-zero transform coefficient levels TotalCoeff(coeff_token) and the number of trailing one transform coefficient levels TrailingOnes(coeff_token) are derived by parsing coeff_token (see subclause 9.2.1) as follows.
 - If the number of non-zero transform coefficient levels TotalCoeff(coeff_token) is equal to 0, the list coeffLevel containing 0 values is returned and no further step is carried out.
 - Otherwise, the following steps are carried out.

- a. The non-zero transform coefficient levels are derived by parsing `trailing_ones_sign_flag`, `level_prefix`, and `level_suffix` (see subclause 9.2.2).
- b. The runs of zero transform coefficient levels before each non-zero transform coefficient level are derived by parsing `total_zeros` and `run_before` (see subclause 9.2.3).
- c. The level and run information are combined into the list `coeffLevel` (see subclause 9.2.4).

9.2.1 Parsing process for total number of transform coefficient levels and trailing ones

Inputs to this process are bits from slice data, a maximum number of non-zero transform coefficient levels `maxNumCoeff`, the luma block index `luma4x4BlkIdx` or the chroma block index `chroma4x4BlkIdx` of the current block of transform.

Outputs of this process are `TotalCoeff( coeff_token )` and `TrailingOnes( coeff_token )`.

The syntax element `coeff_token` is decoded using one of the six VLCs specified in the six right-most columns of Table 9-5. Each VLC specifies both `TotalCoeff( coeff_token )` and `TrailingOnes( coeff_token )` for a given codeword `coeff_token`. VLC selection is dependent upon a variable `nC` that is derived as follows.

- If the CAVLC parsing process is invoked for `ChromaDCLevel`, `nC` is derived as follows.
 - If `chroma_format_idc` is equal to 1, `nC` is set equal to -1,
 - Otherwise, if `chroma_format_idc` is equal to 2, `nC` is set equal to -2,
 - Otherwise (`chroma_format_idc` is equal to 3), `nC` is set equal to 0.
- Otherwise, the following applies.
 - When the CAVLC parsing process is invoked for `Intra16x16DCLevel`, `luma4x4BlkIdx` is set equal to 0.
 - The variables `blkA` and `blkB` are derived as follows.
 - If the CAVLC parsing process is invoked for `Intra16x16DCLevel`, `Intra16x16ACLevel`, or `LumaLevel`, the process specified in subclause 6.4.8.3 is invoked with `luma4x4BlkIdx` as the input, and the output is assigned to `mbAddrA`, `mbAddrB`, `luma4x4BlkIdxA`, and `luma4x4BlkIdxB`. The 4x4 luma block specified by `mbAddrA\luma4x4BlkIdxA` is assigned to `blkA`, and the 4x4 luma block specified by `mbAddrB\luma4x4BlkIdxB` is assigned to `blkB`.
 - Otherwise (the CAVLC parsing process is invoked for `ChromaACLevel`), the process specified in subclause 6.4.8.4 is invoked with `chroma4x4BlkIdx` as input, and the output is assigned to `mbAddrA`, `mbAddrB`, `chroma4x4BlkIdxA`, and `chroma4x4BlkIdxB`. The 4x4 chroma block specified by `mbAddrA\iCbCr\chroma4x4BlkIdxA` is assigned to `blkA`, and the 4x4 chroma block specified by `mbAddrB\iCbCr\chroma4x4BlkIdxB` is assigned to `blkB`.
 - Let `nA` and `nB` be the number of non-zero transform coefficient levels (given by `TotalCoeff( coeff_token )`) in the block of transform coefficient levels `blkA` located to the left of the current block and the block of transform coefficient levels `blkB` located above the current block, respectively.
 - With `N` replaced by `A` and `B`, in `mbAddrN`, `blkN`, and `nN` the following applies.
 - If any of the following conditions is true, `nN` is set equal to 0.
 - `mbAddrN` is not available
 - The current macroblock is coded using an Intra prediction mode, `constrained_intra_pred_flag` is equal to 1 and `mbAddrN` is coded using Inter prediction and slice data partitioning is in use (`nal_unit_type` is in the range of 2 to 4, inclusive).
 - The macroblock `mbAddrN` has `mb_type` equal to `P_Skip` or `B_Skip`
 - All AC residual transform coefficient levels of the neighbouring block `blkN` are equal to 0 due to the corresponding bit of `CodedBlockPatternLuma` or `CodedBlockPatternChroma` being equal to 0
 - Otherwise, if `mbAddrN` is an `I_PCM` macroblock, `nN` is set equal to 16.
 - Otherwise, `nN` is set equal to the value `TotalCoeff( coeff_token )` of the neighbouring block `blkN`.

NOTE - The values nA and nB that are derived using $\text{TotalCoeff}(\text{coeff_token})$ do not include the DC transform coefficient levels in Intra_16x16 macroblocks or DC transform coefficient levels in chroma blocks, because these transform coefficient levels are decoded separately. When the block above or to the left belongs to an Intra_16x16 macroblock, or is a chroma block, nA and nB is the number of decoded non-zero AC transform coefficient levels.

NOTE - When parsing for Intra16x16DCLevel, the values nA and nB are based on the number of non-zero transform coefficient levels in adjacent 4x4 blocks and not on the number of non-zero DC transform coefficient levels in adjacent 16x16 blocks.

- Given the values of nA and nB , the variable nC is derived as follows.
 - If both mbAddrA and mbAddrB are available, the variable nC is set equal to $(nA + nB + 1) \gg 1$.
 - Otherwise (mbAddrA is not available or mbAddrB is not available), the variable nC is set equal to $nA + nB$.

The value of $\text{TotalCoeff}(\text{coeff_token})$ resulting from decoding coeff_token shall be in the range of 0 to maxNumCoeff , inclusive.

9.2.2 Parsing process for level information

Inputs to this process are bits from slice data, the number of non-zero transform coefficient levels $\text{TotalCoeff}(\text{coeff_token})$, and the number of trailing one transform coefficient levels $\text{TrailingOnes}(\text{coeff_token})$.

Output of this process is a list with name level containing transform coefficient levels.

Initially an index i is set equal to 0. Then the following procedure is iteratively applied $\text{TrailingOnes}(\text{coeff_token})$ times to decode the trailing one transform coefficient levels (if any):

- A 1-bit syntax element `trailing_ones_sign_flag` is decoded and evaluated as follows.
 - If `trailing_ones_sign_flag` is equal to 0, the value +1 is assigned to `level[i]`.
 - Otherwise (`trailing_ones_sign_flag` is equal to 1), the value -1 is assigned to `level[i]`.
- The index i is incremented by 1.

Following the decoding of the trailing one transform coefficient levels, a variable `suffixLength` is initialised as follows.

- If $\text{TotalCoeff}(\text{coeff_token})$ is greater than 10 and $\text{TrailingOnes}(\text{coeff_token})$ is less than 3, `suffixLength` is set equal to 1.
- Otherwise ($\text{TotalCoeff}(\text{coeff_token})$ is less than or equal to 10 or $\text{TrailingOnes}(\text{coeff_token})$ is equal to 3), `suffixLength` is set equal to 0.

The following procedure is then applied iteratively $(\text{TotalCoeff}(\text{coeff_token}) - \text{TrailingOnes}(\text{coeff_token}))$ times to decode the remaining levels (if any):

- The syntax element `level_prefix` is decoded as specified in subclause 9.2.2.1.
- The variable `levelSuffixSize` is set equal to the variable `suffixLength` with the exception of the following two cases.
- When `level_prefix` is equal to 14 and `suffixLength` is equal to 0, `levelSuffixSize` is set equal to 4.
- When `level_prefix` is greater than or equal to 15, `levelSuffixSize` is set equal to `level_prefix - 3`.
- The syntax element `level_suffix` is decoded as follows.
 - If `levelSuffixSize` is greater than 0, the syntax element `level_suffix` is decoded as unsigned integer representation $u(v)$ with `levelSuffixSize` bits.
 - Otherwise (`levelSuffixSize` is equal to 0), the syntax element `level_suffix` shall be inferred to be equal to 0.
- A variable `levelCode` is set equal to $(\text{Min}(15, \text{level_prefix}) \ll \text{suffixLength}) + \text{level_suffix}$.
- When `level_prefix` is greater than or equal to 15 and `suffixLength` is equal to 0, `levelCode` is incremented by 15.
- When `level_prefix` is greater than or equal to 16, `levelCode` is incremented by $(1 \ll (\text{level_prefix} - 3)) - 4096$.
- When the index i is equal to $\text{TrailingOnes}(\text{coeff_token})$ and $\text{TrailingOnes}(\text{coeff_token})$ is less than 3, `levelCode` is incremented by 2.
- The variable `level[i]` is derived as follows.
 - If `levelCode` is an even number, the value $(\text{levelCode} + 2) \gg 1$ is assigned to `level[i]`.
 - Otherwise (`levelCode` is an odd number), the value $(-\text{levelCode} - 1) \gg 1$ is assigned to `level[i]`.
- When `suffixLength` is equal to 0, `suffixLength` is set equal to 1.

- When the absolute value of $\text{level}[i]$ is greater than $(3 \ll (\text{suffixLength} - 1))$ and suffixLength is less than 6, suffixLength is incremented by 1.
- The index i is incremented by 1.

9.2.2.1 Parsing process for level_prefix

Inputs to this process are bits from slice data.

Output of this process is `level_prefix`.

The parsing process for this syntax element consists in reading the bits starting at the current location in the bitstream up to and including the first non-zero bit, and counting the number of leading bits that are equal to 0. This process shall be equivalent to the following:

```

leadingZeroBits = -1
for( b = 0; !b; leadingZeroBits++ )
    b = read_bits( 1 )
level_prefix = leadingZeroBits

```

Table 9-6 illustrates the codeword table for `level_prefix`.

Table 9-6 – Codeword table for level_prefix (informative)

14	0000 0000 0000 001
15	0000 0000 0000 0001
...	...

9.2.3 Parsing process for run information

Inputs to this process are bits from slice data, the number of non-zero transform coefficient levels `TotalCoeff( coeff_token )`, and the maximum number of non-zero transform coefficient levels `maxNumCoeff`.

Output of this process is a list of runs of zero transform coefficient levels preceding non-zero transform coefficient levels called run.

Initially, an index i is set equal to 0.

The variable `zerosLeft` is derived as follows.

- If the number of non-zero transform coefficient levels `TotalCoeff( coeff_token )` is equal to the maximum number of non-zero transform coefficient levels `maxNumCoeff`, a variable `zerosLeft` is set equal to 0.

- Otherwise (the number of non-zero transform coefficient levels $\text{TotalCoeff}(\text{coeff_token})$ is less than the maximum number of non-zero transform coefficient levels maxNumCoeff), total_zeros is decoded and zerosLeft is set equal to its value.

The VLC used to decode total_zeros is derived as follows:

- If maxNumCoeff is equal to 4, one of the VLCs specified in Table 9-9 (a) is used.
- Otherwise, if maxNumCoeff is equal to 8, one of the VLCs specified in Table 9-9 (b) is used.
- Otherwise (maxNumCoeff is not equal to 4 and not equal to 8), VLCs from Table 9-7 and Table 9-8 are used.

The following procedure is then applied iteratively ($\text{TotalCoeff}(\text{coeff_token}) - 1$) times:

- The variable $\text{run}[i]$ is derived as follows.
 - If zerosLeft is greater than zero, a value run_before is decoded based on Table 9-10 and zerosLeft . $\text{run}[i]$ is set equal to run_before .
 - Otherwise (zerosLeft is equal to 0), $\text{run}[i]$ is set equal to 0.
- The value of $\text{run}[i]$ is subtracted from zerosLeft and the result assigned to zerosLeft . The result of the subtraction shall be greater than or equal to 0.
- The index i is incremented by 1.

Finally the value of zerosLeft is assigned to $\text{run}[i]$.

9.2.4 Combining level and run information

Input to this process are a list of transform coefficient levels called level, a list of runs called run, and the number of non-zero transform coefficient levels TotalCoeff(coeff_token).

Output of this process is an list coeffLevel of transform coefficient levels.

A variable coeffNum is set equal to -1 and an index i is set equal to (TotalCoeff(coeff_token) – 1). The following procedure is iteratively applied TotalCoeff(coeff_token) times:

- coeffNum is incremented by run[i] + 1.
- coeffLevel[coeffNum] is set equal to level[i].
- The index i is decremented by 1.

9.3 CABAC parsing process for slice data

This process is invoked when parsing syntax elements with descriptor ae(v) in subclauses 7.3.4 and 7.3.5 when entropy_coding_mode_flag is equal to 1.

Inputs to this process are a request for a value of a syntax element and values of prior parsed syntax elements.

Output of this process is the value of the syntax element.

When starting the parsing of the slice data of a slice in subclause 7.3.4, the initialisation process of the CABAC parsing process is invoked as specified in subclause 9.3.1.

The parsing of syntax elements proceeds as follows:

For each requested value of a syntax element a binarization is derived as described in subclause 9.3.2.

The binarization for the syntax element and the sequence of parsed bins determines the decoding process flow as described in subclause 9.3.3.

For each bin of the binarization of the syntax element, which is indexed by the variable `binIdx`, a context index `ctxIdx` is derived as specified in subclause 9.3.3.1.

For each `ctxIdx` the arithmetic decoding process is invoked as specified in subclause 9.3.3.2.

The resulting sequence ($b_0 \dots b_{\text{binIdx}}$) of parsed bins is compared to the set of bin strings given by the binarization process after decoding of each bin. When the sequence matches a bin string in the given set, the corresponding value shall be assigned to the syntax element.

In case the request for a value of a syntax element is processed for the syntax element `mb_type` and the decoded value of `mb_type` is equal to `I_PCM`, the decoding engine shall be initialised after the decoding of any `pcm_alignment_zero_bit` and all `pcm_sample_luma` and `pcm_sample_chroma` data as specified in subclause 9.3.1.2.

The whole CABAC parsing process is illustrated in the flowchart of Figure 9-1 with the abbreviation SE for syntax element.

Figure 9-1 – Illustration of CABAC parsing process for a syntax element SE (informative)

9.3.1 Initialisation process

Outputs of this process are initialised CABAC internal variables.

The processes in subclauses 9.3.1.1 and 9.3.1.2 are invoked when starting the parsing of the slice data of a slice in subclause 7.3.4.

The process in subclause 9.3.1.2 is also invoked after decoding any pcm_alignment_zero_bit and all pcm_sample_luma and pcm_sample_chroma data for a macroblock of type I_PCM.

9.3.1.1 Initialisation process for context variables

Outputs of this process are the initialised CABAC context variables indexed by ctxIdx.

Table 9-12 to Table 9-23 contain the values of the variables n and m used in the initialisation of context variables that are assigned to all syntax elements in subclauses 7.3.4 and 7.3.5 except for the end-of-slice flag.

For each context variable, the two variables pStateIdx and valMPS are initialised.

NOTE - The variable pStateIdx corresponds to a probability state index and the variable valMPS corresponds to the value of the most probable symbol as further described in subclause 9.3.3.2.

The two values assigned to pStateIdx and valMPS for the initialisation are derived from SliceQP_Y, which is derived in Equation 7-27. Given the two table entries (m , n),

1. $\text{preCtxState} = \text{Clip3}(1, 126, ((m * \text{Clip3}(0, 51, \text{SliceQP}_Y)) \gg 4) + n)$
2. $\text{if}(\text{preCtxState} \leq 63) \{$
 $\quad \text{pStateIdx} = 63 - \text{preCtxState}$
 $\quad \text{valMPS} = 0$
 $\quad \text{else} \{$
 $\quad \quad \text{pStateIdx} = \text{preCtxState} - 64$
 $\quad \quad \text{valMPS} = 1$
 $\quad \}$
 $\}$

In Table 9-11, the ctxIdx for which initialisation is needed for each of the slice types are listed. Also listed is the table number that includes the values of m and n needed for the initialisation. For P, SP and B slice type, the initialisation depends also on the value of the cabac_init_idc syntax element. Note that the syntax element names do not affect the initialisation process.

Table 9-11 – Association of ctxIdx and syntax elements for each slice type in the initialisation process

NOTE – ctxIdx equal to 276 is associated with the end_of_slice_flag and the bin of mb_type, which specifies the I_PCM macroblock type. The decoding process specified in subclause 9.3.3.2.4 applies to ctxIdx equal to 276. This decoding process, however, may also be implemented by using the decoding process specified in subclause 9.3.3.2.1. In this case, the initial values associated with ctxIdx equal to 276 are specified to be pStateldx = 63 and valMPS = 0, where pStateldx = 63 represents a non-adapting probability state.

9.3.1.2 Initialisation process for the arithmetic decoding engine

This process is invoked before decoding the first macroblock of a slice or after the decoding of any pcm_alignment_zero_bit and all pcm_sample_luma and pcm_sample_chroma data for a macroblock of type I_PCM.

Outputs of this process are the initialised decoding engine registers codIRange and codIOffset both in 16 bit register precision.

The status of the arithmetic decoding engine is represented by the variables codIRange and codIOffset. In the initialisation procedure of the arithmetic decoding process, codIRange is set equal to 0x01FE and codIOffset is set equal to the value returned from read_bits(9) interpreted as a 9 bit binary representation of an unsigned integer with most significant bit written first.

The bitstream shall not contain data that results in a value of codIOffset being equal to 0x01FE or 0x01FF.

NOTE – The description of the arithmetic decoding engine in this Recommendation | International Standard utilizes 16 bit register precision. However, the minimum register precision for the variables codIRange and codIOffset is 9 bits.

9.3.2 Binarization process

Input to this process is a request for a syntax element.

Output of this process is the binarization of the syntax element, maxBinIdxCtx, ctxIdxOffset, and bypassFlag.

Table 9-25 specifies the type of binarization process, maxBinIdxCtx, and ctxIdxOffset associated with each syntax element.

The specification of the unary (U) binarization process, the truncated unary (TU) binarization process, the concatenated unary / k-th order Exp-Golomb (UEGk) binarization process, and the fixed-length (FL) binarization process are given in subclauses 9.3.2.1 to 9.3.2.4, respectively. Other binarizations are specified in subclauses 9.3.2.5 to 9.3.2.7.

Except for I slices, the binarizations for the syntax element mb_type as specified in subclause 9.3.2.5 consist of bin strings given by a concatenation of prefix and suffix bit strings. The UEGk binarization as specified in 9.3.2.3, which is used for the binarization of the syntax elements mvd_IX (X = 0, 1) and coeff_abs_level_minus1, and the binarization of the coded_block_pattern also consist of a concatenation of prefix and suffix bit strings. For these binarization processes, the prefix and the suffix bit string are separately indexed using the binIdx variable as specified further in subclause 9.3.3. The two sets of prefix bit strings and suffix bit strings are referred to as the binarization prefix part and the binarization suffix part, respectively.

Associated with each binarization or binarization part of a syntax element is a specific value of the context index offset (ctxIdxOffset) variable and a specific value of the maxBinIdxCtx variable as given in Table 9-25. When two values for each of these variables are specified for one syntax element in Table 9-25, the value in the upper row is related to the prefix part while the value in the lower row is related to the suffix part of the binarization of the corresponding syntax element.

The use of the DecodeBypass process and the variable bypassFlag is derived as follows.

- If no value is assigned to ctxIdxOffset for the corresponding binarization or binarization part in Table 9-25 labelled as “na”, all bins of the bit strings of the corresponding binarization or of the binarization prefix/suffix part shall be decoded by invoking the DecodeBypass process as specified in subclause 9.3.3.2.3. In such a case, bypassFlag is set equal to 1, where bypassFlag is used to indicate that for parsing the value of the bin from the bitstream the DecodeBypass process shall be applied.
- Otherwise, for each possible value of binIdx up to the specified value of MaxBinIdxCtx given in Table 9-25, a specific value of the variable ctxIdx is further specified in subclause 9.3.3. bypassFlag is set equal to 0.

The possible values of the context index ctxIdx are in the range 0 to 459, inclusive. The value assigned to ctxIdxOffset specifies the lower value of the range of ctxIdx assigned to the corresponding binarization or binarization part of a syntax element.

ctxIdx = ctxIdxOffset = 276 is assigned to the syntax element end_of_slice_flag and the bin of mb_type, which specifies the I_PCM macroblock type as further specified in subclause 9.3.3.1. For parsing the value of the corresponding bin from the bitstream, the arithmetic decoding process for decisions before termination (DecodeTerminate) as specified in subclause 9.3.3.2.4 shall be applied.

NOTE – The bins of mb_type in I slices and the bins of the suffix for mb_type in SI slices that correspond to the same value of binIdx share the same ctxIdx. The last bin of the prefix of mb_type and the first bin of the suffix of mb_type in P, SP, and B slices may share the same ctxIdx.

Table 9-25 – Syntax elements and associated types of binarization, maxBinIdxCtx, and ctxIdxOffset

Syntax element	Type of binarization	maxBinIdxCtx	ctxIdxOffset
mb_type (SI slices only)	prefix and suffix as specified in subclause 9.3.2.5	prefix: 0 suffix: 6	prefix: 0 suffix: 3
mb_type (I slices only)	as specified in subclause 9.3.2.5	6	3
mb_skip_flag (P, SP slices only)	FL, cMax=1	0	11

mb_field_decoding_flag	FL, cMax=1	0	70
coded_block_pattern	prefix and suffix as specified in subclause 9.3.2.6	prefix: 3 suffix: 1	prefix: 73 suffix: 77
coded_block_flag	FL, cMax=1	0	85
significant_coeff_flag (frame coded blocks with ctxBlockCat < 5)	FL, cMax=1	0	105
last_significant_coeff_flag (frame coded blocks with ctxBlockCat < 5)	FL, cMax=1	0	166
coeff_abs_level_minus1 (blocks with ctxBlockCat < 5)	prefix and suffix as given by UEG0 with signedValFlag=0, uCoff=14	prefix: 1 suffix: na	prefix: 227 suffix: na, (uses DecodeBypass)

coeff_sign_flag	FL, cMax=1	0	na, (uses DecodeBypass)
end_of_slice_flag	FL, cMax=1	0	276
significant_coeff_flag (field coded blocks with ctxBlockCat < 5)	FL, cMax=1	0	277
last_significant_coeff_flag (field coded blocks with ctxBlockCat < 5)	FL, cMax=1	0	338
transform_size_8x8_flag	FL, cMax=1	0	399
significant_coeff_flag (frame coded blocks with ctxBlockCat == 5)	FL, cMax=1	0	402
last_significant_coeff_flag (frame coded blocks with ctxBlockCat == 5)	FL, cMax=1	0	417
coeff_abs_level_minus1 (blocks with ctxBlockCat == 5)	prefix and suffix as given by UEG0 with signedValFlag=0, uCoff=14	prefix: 1 suffix: na	prefix: 426 suffix: na, (uses DecodeBypass)
significant_coeff_flag (field coded blocks with ctxBlockCat == 5)	FL, cMax=1	0	436
last_significant_coeff_flag (field coded blocks with ctxBlockCat == 5)	FL, cMax=1	0	451

9.3.2.1 Unary (U) binarization process

Input to this process is a request for a U binarization for a syntax element.

Output of this process is the U binarization of the syntax element.

The bin string of a syntax element having (unsigned integer) value synElVal is a bit string of length synElVal + 1 indexed by BinIdx. The bins for binIdx less than synElVal are equal to 1. The bin with binIdx equal to synElVal is equal to 0.

Table 9-26 illustrates the bin strings of the unary binarization for a syntax element.

Table 9-26 – Bin string of the unary binarization (informative)

Value of syntax element	Bin string					
0 (1_NxN)	0					
1	1	0				
2	1	1	0			
3	1	1	1	0		
4	1	1	1	1	0	
5	1	1	1	1	1	0
...						
binIdx	0	1	2	3	4	5

9.3.2.2 Truncated unary (TU) binarization process

Input to this process is a request for a TU binarization for a syntax element and cMax.

Output of this process is the TU binarization of the syntax element.

For syntax element (unsigned integer) values less than $cMax$, the U binarization process as specified in subclause 9.3.2.1 is invoked. For the syntax element value equal to $cMax$ the bin string is a bit string of length $cMax$ with all bins being equal to 1.

NOTE – TU binarization is always invoked with a $cMax$ value equal to the largest possible value of the syntax element being decoded.

9.3.2.3 Concatenated unary/ k-th order Exp-Golomb (UEGk) binarization process

Input to this process is a request for a UEGk binarization for a syntax element, `signedValFlag` and `uCoff`.

Output of this process is the UEGk binarization of the syntax element.

A UEGk bin string is a concatenation of a prefix bit string and a suffix bit string. The prefix of the binarization is specified by invoking the TU binarization process for the prefix part $\text{Min}(uCoff, \text{Abs}(\text{synElVal}))$ of a syntax element value `synElVal` as specified in subclause 9.3.2.2 with $cMax = uCoff$, where $uCoff > 0$.

The UEGk bin string is derived as follows.

- If one of the following is true, the bin string of a syntax element having value `synElVal` consists only of a prefix bit string,
 - `signedValFlag` is equal to 0 and the prefix bit string is not equal to the bit string of length `uCoff` with all bits equal to 1.
 - `signedValFlag` is equal to 1 and the prefix bit string is equal to the bit string that consists of a single bit with value equal to 0.
- Otherwise, the bin string of the UEGk suffix part of a syntax element value `synElVal` is specified by a process equivalent to the following pseudo-code:

```

if( Abs( synElVal ) >= uCoff ) {
    sufS = Abs( synElVal ) - uCoff
    stopLoop = 0
    do {
        if( sufS >= ( 1 << k ) ) {
            put( 1 )
            sufS = sufS - ( 1 << k )
            k++
        } else {
            put( 0 )
            while( k-- )
                put( ( sufS >> k ) & 0x01 )
            stopLoop = 1
        }
    } while( !stopLoop )
}
if( signedValFlag && synElVal != 0 )
    if( synElVal > 0 )
        put( 0 )
    else
        put( 1 )

```

NOTE – The specification for the k-th order Exp-Golomb (EGk) code uses 1's and 0's in reverse meaning for the unary part of the Exp-Golomb code of 0-th order as specified in subclause 9.1.

9.3.2.4 Fixed-length (FL) binarization process

Input to this process is a request for a FL binarization for a syntax element and $cMax$.

Output of this process is the FL binarization of the syntax element.

FL binarization is constructed by using an `fixedLength`-bit unsigned integer bin string of the syntax element value, where $\text{fixedLength} = \text{Ceil}(\text{Log2}(\text{cMax} + 1))$. The indexing of bins for the FL binarization is such that the `binIdx = 0` relates to the least significant bit with increasing values of `binIdx` towards the most significant bit.

9.3.2.5 Binarization process for macroblock type and sub-macroblock type

Input to this process is a request for a binarization for syntax elements `mb_type` or `sub_mb_type`.

Output of this process is the binarization of the syntax element.

The binarization scheme for decoding of macroblock type in I slices is specified in Table 9-27.

For macroblock types in SI slices, the binarization consists of bin strings specified as a concatenation of a prefix and a suffix bit string as follows.

The prefix bit string consists of a single bit, which is specified by $b_0 = ((\text{mb_type} == \text{SI}) ? 0 : 1)$. For the syntax element value for which b_0 is equal to 0, the bin string only consists of the prefix bit string. For the syntax element value for which b_0 is equal to 1, the binarization is given by concatenating the prefix b_0 and the suffix bit string as specified in Table 9-27 for macroblock type in I slices indexed by subtracting 1 from the value of `mb_type` in SI slices.

The binarization schemes for P macroblock types in P and SP slices and for B macroblocks in B slices are specified in Table 9-28.

The bin string for I macroblock types in P and SP slices corresponding to `mb_type` values 5 to 30 consists of a concatenation of a prefix, which consists of a single bit with value equal to 1 as specified in Table 9-28 and a suffix as specified in Table 9-27, indexed by subtracting 5 from the value of `mb_type`.

`mb_type` equal to 4 (`P_8x8ref0`) is not allowed..

For I macroblock types in B slices (`mb_type` values 23 to 48) the binarization consists of bin strings specified as a concatenation of a prefix bit string as specified in Table 9-28 and suffix bit strings as specified in Table 9-27, indexed by subtracting 23 from the value of `mb_type`.

Table 9-27 – Binarization for macroblock types in I slices

Value (name) of mb_type	Bin string						
0 (I_4x4)	0						
1 (I_16x16_0_0_0)	1	0	0	0	0	0	
2 (I_16x16_1_0_0)	1	0	0	0	0	1

binIdx		0	1	2	3	4	5	6	

For P, SP, and B slices the specification of the binarization for sub_mb_type is given in Table 9-29.

Table 9-29 – Binarization for sub-macroblock types in P, SP, and B slices

Slice type	Value (name) of sub_mb_type	Bin string					
P, SP slice	0 (P_L0_8x8)	1					
	1 (P_L0_8x4)	0	0				
	2 (P_L0_4x8)	0	1	1			
	3 (P_L0_4x4)	0	1	0			
B slice	0 (B_Direct_8x8)	0					
	1 (B_L0_8x8)	1	0	0			
	2 (B_L1_8x8)	1	0	1			
	3 (B_Bi_8x8)	1	1	0	0	0	
	4 (B_L0_8x4)	1	1	0	0	1	
	5 (B_L0_4x8)	1	1	0	1	0	
	6 (B_L1_8x4)	1	1	0	1	1	
	7 (B_L1_4x8)	1	1	1	0	0	0
	8 (B_Bi_8x4)	1	1	1	0	0	1
	9 (B_Bi_4x8)	1	1	1	0	1	0
	10 (B_L0_4x4)	1	1	1	0	1	1
	11 (B_L1_4x4)	1	1	1	1	0	
	12 (B_Bi_4x4)	1	1	1	1	1	
binIdx		0	1	2	3	4	5

9.3.2.6 Binarization process for coded block pattern

Input to this process is a request for a binarization for the syntax element coded_block_pattern.

Output of this process is the binarization of the syntax element.

The binarization of coded_block_pattern consists of a prefix part and (when present) a suffix part. The prefix part of the binarization is given by the FL binarization of CodedBlockPatternLuma with cMax = 15. When chroma_format_idc is not equal to 0 (monochrome), the suffix part is present and consists of the TU binarization of CodedBlockPatternChroma with cMax = 2. The relationship between the value of the syntax element coded_block_pattern and the values of CodedBlockPatternLuma and CodedBlockPatternChroma is given as specified in subclause 7.4.5.

9.3.2.7 Binarization process for mb_qp_delta

Input to this process is a request for a binarization for the syntax element mb_qp_delta.

Output of this process is the binarization of the syntax element.

The bin string of mb_qp_delta is derived by the U binarization of the mapped value of the syntax element mb_qp_delta, where the assignment rule between the signed value of mb_qp_delta and its mapped value is given as specified in Table 9-3.

9.3.3 Decoding process flow

Input to this process is a binarization of the requested syntax element, `maxBinIdxCtx`, `bypassFlag` and `ctxIdxOffset` as specified in subclause 9.3.2.

Output of this process is the value of the syntax element.

This process specifies how each bit of a bit string is parsed for each syntax element.

After parsing each bit, the resulting bit string is compared to all bin strings of the binarization of the syntax element and the following applies.

- If the bit string is equal to one of the bin strings, the corresponding value of the syntax element is the output.
- Otherwise (the bit string is not equal to one of the bin strings), the next bit is parsed.

While parsing each bin, the variable `binIdx` is incremented by 1 starting with `binIdx` being set equal to 0 for the first bin.

When the binarization of the corresponding syntax element consists of a prefix and a suffix binarization part, the variable `binIdx` is set equal to 0 for the first bin of each part of the bin string (prefix part or suffix part). In this case, after parsing the prefix bit string, the parsing process of the suffix bit string related to the binarizations specified in subclauses 9.3.2.3 and 9.3.2.5 is invoked depending on the resulting prefix bit string as specified in subclauses 9.3.2.3 and 9.3.2.5. Note that for the binarization of the syntax element `coded_block_pattern`, the suffix bit string is present regardless of the prefix bit string of length 4 as specified in subclause 9.3.2.6.

Depending on the variable `bypassFlag`, the following applies.

- If `bypassFlag` is equal to 1, the bypass decoding process as specified in subclause 9.3.3.2.3 shall be applied for parsing the value of the bins from the bitstream.
- Otherwise (`bypassFlag` is equal to 0), the parsing of each bin is specified by the following two ordered steps:
 1. Given `binIdx`, `maxBinIdxCtx` and `ctxIdxOffset`, `ctxIdx` is derived as specified in subclause 9.3.3.1.
 2. Given `ctxIdx`, the value of the bin from the bitstream as specified in subclause 9.3.3.2 is decoded.

9.3.3.1 Derivation process for `ctxIdx`

Inputs to this process are `binIdx`, `maxBinIdxCtx` and `ctxIdxOffset`.

Output of this process is `ctxIdx`.

Table 9-30 shows the assignment of `ctxIdx` increments (`ctxIdxInc`) to `binIdx` for all `ctxIdxOffset` values except those related to the syntax elements `coded_block_flag`, `significant_coeff_flag`, `last_significant_coeff_flag`, and `coeff_abs_level_minus1`.

The `ctxIdx` to be used with a specific `binIdx` is specified by first determining the `ctxIdxOffset` associated with the given bin string or part thereof. The `ctxIdx` is determined as follows.

- If the `ctxIdxOffset` is listed in Table 9-30, the `ctxIdx` for a `binIdx` is the sum of `ctxIdxOffset` and `ctxIdxInc`, which is found in Table 9-30. When more than one value is listed in Table 9-30 for a `binIdx`, the assignment process for `ctxIdxInc` for that `binIdx` is further specified in the subclauses given in parenthesis of the corresponding table entry.
- Otherwise (`ctxIdxOffset` is not listed in Table 9-30), the `ctxIdx` is specified to be the sum of the following terms: `ctxIdxOffset` and `ctxIdxBlockCatOffset(ctxBlockCat)` as specified in Table 9-31 and `ctxIdxInc(ctxBlockCat)`. Subclause 9.3.3.1.3 specifies which `ctxBlockCat` is used. Subclause 9.3.3.1.1.9 specifies the assignment of `ctxIdxInc(ctxBlockCat)` for `coded_block_flag`, and subclause 9.3.3.1.3 specifies the assignment of `ctxIdxInc(ctxBlockCat)` for `significant_coeff_flag`, `last_significant_coeff_flag`, and `coeff_abs_level_minus1`.

All bins with `binIdx` greater than `maxBinIdxCtx` are parsed using `ctxIdx` assigned to `maxBinIdxCtx`.

All entries in Table 9-30 labelled with “na” correspond to values of `binIdx` that do not occur for the corresponding `ctxIdxOffset`.

`ctxIdx = 276` is assigned to the `binIdx` of `mb_type` indicating the `I_PCM` mode. For parsing the value of the corresponding bins from the bitstream, the arithmetic decoding process for decisions before termination as specified in subclause 9.3.3.2.4 shall be applied.

Table 9-30 – Assignment of ctxIdxInc to binIdx for all ctxIdxOffset values except those related to the syntax elements coded_block_flag, significant_coeff_flag, last_significant_coeff_flag, and coeff_abs_level_minus1

ctxIdxOffset	binIdx						
	0	1	2	3	4	5	≥ 6
0	0,1,2 (subclause 9.3.3.1.1.3)	na	na	na	na	na	na
3	0,1,2 (subclause 9.3.3.1.1.3)	ctxIdx=276	3	4	5,6 (subclause 9.3.3.1.2)	6,7 (subclause 9.3.3.1.2)	7
11	0,1,2 (subclause 9.3.3.1.1.1)	na	na	na	na	na	na
14	0	1	2,3 (subclause 9.3.3.1.2)	na	na	na	na
17	0	ctxIdx=276	1	2	2,3 (subclause 9.3.3.1.2)	3	3
21	0	1	2	na	na	na	na
24	0,1,2 (subclause 9.3.3.1.1.1)	na	na	na	na	na	na
27	0,1,2 (subclause 9.3.3.1.1.3)	3	4,5 (subclause 9.3.3.1.2)	5	5	5	5
32	0	ctxIdx=276	1	2	2,3 (subclause 9.3.3.1.2)	3	3
36	0	1	2,3 (subclause 9.3.3.1.2)	3	3	3	na
40	0,1,2 (subclause 9.3.3.1.1.7)	3	4	5	6	6	6
47	0,1,2 (subclause 9.3.3.1.1.7)	3	4	5	6	6	6
54	0,1,2,3 (subclause 9.3.3.1.1.6)	4	5	5	5	5	5
60	0,1 (subclause 9.3.3.1.1.5)	2	3	3	3	3	3
64	0,1,2 (subclause 9.3.3.1.1.8)	3	3	na	na	na	na
68	0	na	na	na	na	na	na
69	0	0	0	na	na	na	na
70	0,1,2 (subclause 9.3.3.1.1.2)	na	na	na	na	na	na
73	0,1,2,3 (subclause 9.3.3.1.1.4)	0,1,2,3 (subclause 9.3.3.1.1.4)	0,1,2,3 (subclause 9.3.3.1.1.4)	0,1,2,3 (subclause 9.3.3.1.1.4)	na	na	na
77	0,1,2,3 (subclause 9.3.3.1.1.4)	4,5,6,7 (subclause 9.3.3.1.1.4)	na	na	na	na	na
276	0	na	na	na	na	na	na
399	0,1,2 (subclause 9.3.3.1.1.10)	na	na	na	na	na	na

Table 9-31 shows the values of ctxIdxBlockCatOffset depending on ctxBlockCat for the syntax elements coded_block_flag, significant_coeff_flag, last_significant_coeff_flag, and coeff_abs_level_minus1. The specification of ctxBlockCat is given in Table 9-33.

Table 9-31 – Assignment of ctxIdxBlockCatOffset to ctxBlockCat for syntax elements coded_block_flag, significant_coeff_flag, last_significant_coeff_flag, and coeff_abs_level_minus1

Syntax element	ctxBlockCat (as specified in Table 9-33)					
	0	1	2	3	4	5
coded_block_flag	0	4	8	12	16	na
significant_coeff_flag	0	15	29	44	47	0
last_significant_coeff_flag	0	15	29	44	47	0
coeff_abs_level_minus1	0	10	20	30	39	0

9.3.3.1.1 Assignment process of ctxIdxInc using neighbouring syntax elements

Subclause 9.3.3.1.1.1 specifies the derivation process of ctxIdxInc for the syntax element mb_skip_flag.

Subclause 9.3.3.1.1.2 specifies the derivation process of ctxIdxInc for the syntax element mb_field_decoding_flag.

Subclause 9.3.3.1.1.3 specifies the derivation process of ctxIdxInc for the syntax element mb_type.

Subclause 9.3.3.1.1.4 specifies the derivation process of ctxIdxInc for the syntax element coded_block_pattern.

Subclause 9.3.3.1.1.5 specifies the derivation process of ctxIdxInc for the syntax element mb_qp_delta.

Subclause 9.3.3.1.1.6 specifies the derivation process of ctxIdxInc for the syntax elements ref_idx_l0 and ref_idx_l1.

Subclause 9.3.3.1.1.7 specifies the derivation process of ctxIdxInc for the syntax elements mvd_l0 and mvd_l1.

Subclause 9.3.3.1.1.8 specifies the derivation process of ctxIdxInc for the syntax element intra_chroma_pred_mode.

Subclause 9.3.3.1.1.9 specifies the derivation process of ctxIdxInc for the syntax element coded_block_flag.

Subclause 9.3.3.1.1.10 specifies the derivation process of ctxIdxInc for the syntax element transform_size_8x8_flag.

9.3.3.1.1.1 Derivation process of ctxIdxInc for the syntax element mb_skip_flag

Output of this process is ctxIdxInc.

When MbaffFrameFlag is equal to 1 and mb_field_decoding_flag has not been decoded (yet) for the current macroblock pair with top macroblock address $2 * (CurrMbAddr / 2)$, the inference rule for the syntax element mb_field_decoding_flag as specified in subclause 7.4.4 shall be applied.

The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to mbAddrA and mbAddrB.

Let the variable condTermFlagN (with N being either A or B) be derived as follows.

- If mbAddrN is not available or mb_skip_flag for the macroblock mbAddrN is equal to 1, condTermFlagN is set equal to 0.
- Otherwise (mbAddrN is available and mb_skip_flag for the macroblock mbAddrN is equal to 0), condTermFlagN is set equal to 1.

The variable ctxIdxInc is derived by

$$ctxIdxInc = condTermFlagA + condTermFlagB \quad (9-1)$$

9.3.3.1.1.2 Derivation process of ctxIdxInc for the syntax element mb_field_decoding_flag

Output of this process is ctxIdxInc.

The derivation process for neighbouring macroblock addresses and their availability in MBAFF frames as specified in subclause 6.4.7 is invoked and the output is assigned to mbAddrA and mbAddrB.

When both macroblocks $mbAddrN$ and $mbAddrN + 1$ have mb_type equal to P_Skip or B_Skip , the inference rule for the syntax element $mb_field_decoding_flag$ as specified in subclause 7.4.4 shall be applied for the macroblock $mbAddrN$.

Let the variable $condTermFlagN$ (with N being either A or B) be derived as follows.

- If any of the following conditions is true, $condTermFlagN$ is set equal to 0,
 - $mbAddrN$ is not available
 - the macroblock $mbAddrN$ is a frame macroblock.
- Otherwise, $condTermFlagN$ is set equal to 1.

The variable $ctxIdxInc$ is derived by

$$ctxIdxInc = condTermFlagA + condTermFlagB \quad (9-2)$$

9.3.3.1.1.3 Derivation process of $ctxIdxInc$ for the syntax element mb_type

Input to this process is $ctxIdxOffset$.

Output of this process is $ctxIdxInc$.

The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to $mbAddrA$ and $mbAddrB$.

Let the variable $condTermFlagN$ (with N being either A or B) be derived as follows.

- If any of the following conditions is true, $condTermFlagN$ is set equal to 0
 - $mbAddrN$ is not available
 - $ctxIdxOffset$ is equal to 0 and mb_type for the macroblock $mbAddrN$ is equal to SI
 - $ctxIdxOffset$ is equal to 3 and mb_type for the macroblock $mbAddrN$ is equal to I_NxN
 - $ctxIdxOffset$ is equal to 27 and the macroblock $mbAddrN$ is skipped
 - $ctxIdxOffset$ is equal to 27 and mb_type for the macroblock $mbAddrN$ is equal to B_Direct_16x16
- Otherwise, $condTermFlagN$ is set equal to 1.

The variable $ctxIdxInc$ is derived as

$$ctxIdxInc = condTermFlagA + condTermFlagB \quad (9-3)$$

9.3.3.1.1.4 Derivation process of $ctxIdxInc$ for the syntax element $coded_block_pattern$

Inputs to this process are $ctxIdxOffset$ and $binIdx$.

Output of this process is $ctxIdxInc$.

Depending on the value of the variable $ctxIdxOffset$, the following applies.

- If $ctxIdxOffset$ is equal to 73, the following applies
 - The derivation process for neighbouring $8x8$ luma blocks specified in subclause 6.4.8.2 is invoked with $luma8x8BlkIdx = binIdx$ as input and the output is assigned to $mbAddrA$, $mbAddrB$, $luma8x8BlkIdxA$, and $luma8x8BlkIdxB$.
 - Let the variable $condTermFlagN$ (with N being either A or B) be derived as follows.
 - If any of the following conditions are true, $condTermFlagN$ is set equal to 0
 - $mbAddrN$ is not available
 - mb_type for the macroblock $mbAddrN$ is equal to I_PCM
 - the macroblock $mbAddrN$ is not the current macroblock $CurrMbAddr$ and the macroblock $mbAddrN$ is not skipped and $((CodedBlockPatternLuma \gg luma8x8BlkIdxN) \& 1)$ is not equal to 0 for the value of $CodedBlockPatternLuma$ for the macroblock $mbAddrN$

- the macroblock mbAddrN is the current macroblock CurrMbAddr and the prior decoded bin value b_k of coded_block_pattern with $k = \text{luma8x8BlkIdxN}$ is not equal to 0.
- Otherwise, condTermFlagN is set equal to 1.
- The variable ctxIdxInc is derived as

$$\text{ctxIdxInc} = \text{condTermFlagA} + 2 * \text{condTermFlagB} \quad (9-4)$$

- Otherwise (ctxIdxOffset is equal to 77), the following applies.
 - The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to mbAddrA and mbAddrB.
 - Let the variable condTermFlagN (with N being either A or B) be derived as follows.
 - If mbAddrN is available and mb_type for the macroblock mbAddrN is equal to I_PCM, condTermFlagN is set equal to 1
 - Otherwise, if any of the following conditions is true, condTermFlagN is set equal to 0
 - mbAddrN is not available or the macroblock mbAddrN is skipped
 - binIdx is equal to 0 and CodedBlockPatternChroma for the macroblock mbAddrN is equal to 0
 - binIdx is equal to 1 and CodedBlockPatternChroma for the macroblock mbAddrN is not equal to 2
 - Otherwise, condTermFlagN is set equal to 1.
 - The variable ctxIdxInc is derived as

$$\text{ctxIdxInc} = \text{condTermFlagA} + 2 * \text{condTermFlagB} + ((\text{binIdx} == 1) ? 4 : 0) \quad (9-5)$$

NOTE – When a macroblock uses an Intra_16x16 prediction mode, the values of CodedBlockPatternLuma and CodedBlockPatternChroma for the macroblock are derived from mb_type as specified in Table 7-11.

9.3.3.1.1.5 Derivation process of ctxIdxInc for the syntax element mb_qp_delta

Output of this process is ctxIdxInc.

Let prevMbAddr be the macroblock address of the macroblock that precedes the current macroblock in decoding order. When the current macroblock is the first macroblock of a slice, prevMbAddr is marked as not available.

Let the variable ctxIdxInc be derived as follows.

- If any of the following conditions is true, ctxIdxInc is set equal to 0
 - prevMbAddr is not available or the macroblock prevMbAddr is skipped
 - mb_type of the macroblock prevMbAddr is equal to I_PCM
 - The macroblock prevMbAddr is not coded in Intra_16x16 prediction mode and both CodedBlockPatternLuma and CodedBlockPatternChroma for the macroblock prevMbAddr are equal to 0
 - mb_qp_delta for the macroblock prevMbAddr is equal to 0
- Otherwise, ctxIdxInc is set equal to 1.

9.3.3.1.1.6 Derivation process of ctxIdxInc for the syntax elements ref_idx_10 and ref_idx_11

Input to this process is mbPartIdx.

Output of this process is ctxIdxInc.

The interpretation of ref_idx_IX and Pred_LX within this subclause is specified as follows.

- If this process is invoked for the derivation of ref_idx_10, ref_idx_IX is interpreted as ref_idx_10 and Pred_LX is interpreted as Pred_L0.

- Otherwise (this process is invoked for the derivation of ref_idx_l1), ref_idx_lX is interpreted as ref_idx_l1 and Pred_lX is interpreted as Pred_l1 .

Let currSubMbType be set equal to $\text{sub_mb_type}[\text{mbPartIdx}]$.

The derivation process for neighbouring partitions specified in subclause 6.4.8.5 is invoked with mbPartIdx , currSubMbType , and $\text{subMbPartIdx} = 0$ as input and the output is assigned to $\text{mbAddrA}[\text{mbPartIdxA}]$ and $\text{mbAddrB}[\text{mbPartIdxB}]$.

With $\text{ref_idx_lX}[\text{mbPartIdxN}]$ (with N being either A or B) specifying the syntax element for the macroblock mbAddrN , let the variable refIdxZeroFlagN be derived as follows.

- If MbaffFrameFlag is equal to 1, the current macroblock is a frame macroblock, and the macroblock mbAddrN is a field macroblock

$$\text{refIdxZeroFlagN} = ((\text{ref_idx_lX}[\text{mbPartIdxN}] > 1) ? 0 : 1) \quad (9-6)$$

- Otherwise,

$$\text{refIdxZeroFlagN} = ((\text{ref_idx_lX}[\text{mbPartIdxN}] > 0) ? 0 : 1) \quad (9-7)$$

Let the variable $\text{predModeEqualFlagN}$ be specified as follows.

- If the macroblock mbAddrN has mb_type equal to P_8x8 or B_8x8 , the following applies.
 - If $\text{SubMbPredMode}(\text{sub_mb_type}[\text{mbPartIdxN}])$ is not equal to Pred_lX and not equal to BiPred , $\text{predModeEqualFlagN}$ is set equal to 0, where sub_mb_type specifies the syntax element for the macroblock mbAddrN .
 - Otherwise, $\text{predModeEqualFlagN}$ is set equal to 1.
- Otherwise, the following applies.
 - If $\text{MbPartPredMode}(\text{mb_type}, \text{mbPartIdxN})$ is not equal to Pred_lX and not equal to BiPred , $\text{predModeEqualFlagN}$ is set equal to 0, where mb_type specifies the syntax element for the macroblock mbAddrN .
 - Otherwise, $\text{predModeEqualFlagN}$ is set equal to 1.

Let the variable condTermFlagN (with N being either A or B) be derived as follows.

- If any of the following conditions is true, condTermFlagN is set equal to 0
 - mbAddrN is not available
 - the macroblock mbAddrN has mb_type equal to P_Skip or B_Skip
 - The macroblock mbAddrN is coded in Intra prediction mode
 - $\text{predModeEqualFlagN}$ is equal to 0
 - refIdxZeroFlagN is equal to 1
- Otherwise, condTermFlagN is set equal to 1.

The variable ctxIdxInc is derived as

$$\text{ctxIdxInc} = \text{condTermFlagA} + 2 * \text{condTermFlagB} \quad (9-8)$$

9.3.3.1.1.7 Derivation process of ctxIdxInc for the syntax elements mvd_l0 and mvd_l1

Inputs to this process are mbPartIdx , subMbPartIdx , and ctxIdxOffset .

Output of this process is ctxIdxInc .

The interpretation of mvd_lX and Pred_lX within this subclause is specified as follows.

- If this process is invoked for the derivation of mvd_l0 , mvd_lX is interpreted as mvd_l0 and Pred_lX is interpreted as Pred_l0 .

- Otherwise (this process is invoked for the derivation of mvd_l1), mvd_lX is interpreted as mvd_l1 and $Pred_lX$ is interpreted as $Pred_l1$.

Let $currSubMbType$ be set equal to $sub_mb_type[mbPartIdx]$.

The derivation process for neighbouring partitions specified in subclause 6.4.8.5 is invoked with $mbPartIdx$, $currSubMbType$, and $subMbPartIdx$ as input and the output is assigned to $mbAddrA\backslash mbPartIdxA\backslash subMbPartIdxA$ and $mbAddrB\backslash mbPartIdxB\backslash subMbPartIdxB$.

Let the variable $compIdx$ be derived as follows.

- If $ctxIdxOffset$ is equal to 40, $compIdx$ is set equal to 0.
- Otherwise ($ctxIdxOffset$ is equal to 47), $compIdx$ is set equal to 1.

Let the variable $predModeEqualFlagN$ be specified as follows.

- If the macroblock $mbAddrN$ has mb_type equal to P_8x8 or B_8x8, the following applies.
 - If $SubMbPredMode(sub_mb_type[mbPartIdxN])$ is not equal to $Pred_lX$ and not equal to BiPred, $predModeEqualFlagN$ is set equal to 0, where sub_mb_type specifies the syntax element for the macroblock $mbAddrN$.
 - Otherwise, $predModeEqualFlagN$ is set equal to 1.
- Otherwise, the following applies.
 - If $MbPartPredMode(mb_type, mbPartIdxN)$ is not equal to $Pred_lX$ and not equal to BiPred, $predModeEqualFlagN$ is set equal to 0, where mb_type specifies the syntax element for the macroblock $mbAddrN$.
 - Otherwise, $predModeEqualFlagN$ is set equal to 1.

Let the variable $absMvdCompN$ (with N being either A or B) be derived as follows.

- If any of the following conditions is true, $absMvdCompN$ is set equal to 0
 - $mbAddrN$ is not available
 - the macroblock $mbAddrN$ has mb_type equal to P_Skip or B_Skip
 - The macroblock $mbAddrN$ is coded in Intra prediction mode
 - $predModeEqualFlagN$ is equal to 0
- Otherwise, the following applies
 - If $compIdx$ is equal to 1, $MbaffFrameFlag$ is equal to 1, the current macroblock is a frame macroblock, and the macroblock $mbAddrN$ is a field macroblock

$$absMvdCompN = Abs(mvd_lX[mbPartIdxN][subMbPartIdxN][compIdx]) * 2 \quad (9-9)$$

- Otherwise, if $compIdx$ is equal to 1, $MbaffFrameFlag$ is equal to 1, the current macroblock is a field macroblock, and the macroblock $mbAddrN$ is a frame macroblock

$$absMvdCompN = Abs(mvd_lX[mbPartIdxN][subMbPartIdxN][compIdx]) / 2 \quad (9-10)$$

- Otherwise,

$$absMvdCompN = Abs(mvd_lX[mbPartIdxN][subMbPartIdxN][compIdx]) \quad (9-11)$$

The variable `ctxIdxInc` is derived as follows

- If (`absMvdCompA + absMvdCompB`) is less than 3, `ctxIdxInc` is set equal to 0.
- Otherwise, if (`absMvdCompA + absMvdCompB`) is greater than 32, `ctxIdxInc` is set equal to 2.
- Otherwise ((`absMvdCompA + absMvdCompB`) is in the range of 3 to 32, inclusive), `ctxIdxInc` is set equal to 1.

9.3.3.1.1.8 Derivation process of `ctxIdxInc` for the syntax element `intra_chroma_pred_mode`

Output of this process is `ctxIdxInc`.

The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to `mbAddrA` and `mbAddrB`.

Let the variable `condTermFlagN` (with `N` being replaced by either `A` or `B`) be derived as follows.

- If any of the following conditions is true, `condTermFlagN` is set equal to 0
 - `mbAddrN` is not available
 - The macroblock `mbAddrN` is coded in Inter prediction mode
 - `mb_type` for the macroblock `mbAddrN` is equal to `I_PCM`
 - `intra_chroma_pred_mode` for the macroblock `mbAddrN` is equal to 0
- Otherwise, `condTermFlagN` is set equal to 1.

The variable `ctxIdxInc` is derived by

$$\text{ctxIdxInc} = \text{condTermFlagA} + \text{condTermFlagB} \quad (9-12)$$

9.3.3.1.1.9 Derivation process of `ctxIdxInc` for the syntax element `coded_block_flag`

Input to this process is `ctxBlockCat` and additional input is specified as follows.

- If `ctxBlockCat` is equal to 0, no additional input
- Otherwise, if `ctxBlockCat` is equal to 1 or 2, `luma4x4BlkIdx`
- Otherwise, if `ctxBlockCat` is equal to 3, the chroma component index `iCbCr`
- Otherwise (`ctxBlockCat` is equal to 4), `chroma4x4BlkIdx` and the chroma component index `iCbCr`

Output of this process is `ctxIdxInc( ctxBlockCat )`.

Let the variable `transBlockN` (with `N` being either `A` or `B`) be derived as follows.

- If `ctxBlockCat` is equal to 0, the following applies.
 - The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to `mbAddrN` (with `N` being either `A` or `B`).
 - The variable `transBlockN` is derived as follows.
 - If `mbAddrN` is available and the macroblock `mbAddrN` is coded in `Intra_16x16` prediction mode, the luma DC block of macroblock `mbAddrN` is assigned to `transBlockN`
 - Otherwise, `transBlockN` is marked as not available.
- Otherwise, if `ctxBlockCat` is equal to 1 or 2, the following applies.
 - The derivation process for neighbouring 4x4 luma blocks specified in subclause 6.4.8.3 is invoked with `luma4x4BlkIdx` as input and the output is assigned to `mbAddrN`, `luma4x4BlkIdxN` (with `N` being either `A` or `B`).
 - The variable `transBlockN` is derived as follows.
 - If `mbAddrN` is available, the macroblock `mbAddrN` is not skipped, `mb_type` for the macroblock `mbAddrN` is not equal to `I_PCM`, ((`CodedBlockPatternLuma` >> (`luma4x4BlkIdxN` >> 2)) & 1) is not equal to 0 for the macroblock `mbAddrN`, and `transform_size_8x8_flag` is equal to 0 for the macroblock `mbAddrN`, the 4x4 luma block with index `luma4x4BlkIdxN` of macroblock `mbAddrN` is assigned to `transBlockN`.

- Otherwise, if mbAddrN is available, the macroblock mbAddrN is not skipped, $((\text{CodedBlockPatternLuma} \gg (\text{luma4x4BlkIdxN} \gg 2)) \& 1)$ is not equal to 0 for the macroblock mbAddrN, and transform_size_8x8_flag is equal to 1 for the macroblock mbAddrN, the 8x8 luma block with index $(\text{luma4x4BlkIdxN} \gg 2)$ of macroblock mbAddrN is assigned to transBlockN.
- Otherwise, transBlockN is marked as not available.
- Otherwise, if ctxBlockCat is equal to 3, the following applies.
 - The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to mbAddrN (with N being either A or B).
 - The variable transBlockN is derived as follows.
 - If mbAddrN is available, the macroblock mbAddrN is not skipped, mb_type for the macroblock mbAddrN is not equal to I_PCM, and CodedBlockPatternChroma is not equal to 0 for the macroblock mbAddrN, the chroma DC block of chroma component iCbCr of macroblock mbAddrN is assigned to transBlockN.
 - Otherwise, transBlockN is marked as not available.
- Otherwise (ctxBlockCat is equal to 4), the following applies.
 - The derivation process for neighbouring 4x4 chroma blocks specified in subclause 6.4.8.4 is invoked with chroma4x4BlkIdx as input and the output is assigned to mbAddrN, chroma4x4BlkIdxN (with N being either A or B).
 - The variable transBlockN is derived as follows.
 - If mbAddrN is available, the macroblock mbAddrN is not skipped, mb_type for the macroblock mbAddrN is not equal to I_PCM, and CodedBlockPatternChroma is equal to 2 for the macroblock mbAddrN, the 4x4 chroma block with chroma4x4BlkIdxN of the chroma component iCbCr of macroblock mbAddrN is assigned to transBlockN.
 - Otherwise, transBlockN is marked as not available.

Let the variable condTermFlagN (with N being either A or B) be derived as follows.

- If any of the following conditions is true, condTermFlagN is set equal to 0
 - mbAddrN is not available and the current macroblock is coded in Inter prediction mode
 - mbAddrN is available and transBlockN is not available and mb_type for the macroblock mbAddrN is not equal to I_PCM
 - The current macroblock is coded in Intra prediction mode, constrained_intra_pred_flag is equal to 1, the macroblock mbAddrN is available and coded in Inter prediction mode, and slice data partitioning is in use (nal_unit_type is in the range of 2 through 4, inclusive).
- Otherwise, if any of the following conditions is true, condTermFlagN is set equal to 1
 - mbAddrN is not available and the current macroblock is coded in Intra prediction mode
 - mb_type for the macroblock mbAddrN is equal to I_PCM
- Otherwise, condTermFlagN is set equal to the value of the coded_block_flag of the transform block transBlockN that was decoded for the macroblock mbAddrN.

The variable ctxIdxInc(ctxBlockCat) is derived by

$$\text{ctxIdxInc}(\text{ctxBlockCat}) = \text{condTermFlagA} + 2 * \text{condTermFlagB} \quad (9-13)$$

9.3.3.1.1.10 Derivation process of ctxIdxInc for the syntax element transform_size_8x8_flag

Output of this process is ctxIdxInc.

The derivation process for neighbouring macroblocks specified in subclause 6.4.8.1 is invoked and the output is assigned to mbAddrA and mbAddrB.

Let the variable `condTermFlagN` (with `N` being either `A` or `B`) be derived as follows.

- If any of the following conditions is true, `condTermFlagN` is set equal to 0.
 - `mbAddrN` is not available
 - `transform_size_8x8_flag` for the macroblock `mbAddrN` is equal to 0
- Otherwise, `condTermFlagN` is set equal to 1.

The variable `ctxIdxInc` is derived by

$$\text{ctxIdxInc} = \text{condTermFlagA} + \text{condTermFlagB} \quad (9-14)$$

9.3.3.1.2 Assignment process of `ctxIdxInc` using prior decoded bin values

Inputs to this process are `ctxIdxOffset` and `binIdx`.

Output of this process is `ctxIdxInc`.

Table 9-32 contains the specification of `ctxIdxInc` for the given values of `ctxIdxOffset` and `binIdx`.

For each value of `ctxIdxOffset` and `binIdx`, `ctxIdxInc` is derived by using some of the values of prior decoded bin values ($b_0, b_1, b_2, \dots, b_k$), where the value of the index k is less than the value of `binIdx`.

Table 9-32 – Specification of `ctxIdxInc` for specific values of `ctxIdxOffset` and `binIdx`

Value (name) of <code>ctxIdxOffset</code>	<code>binIdx</code>	<code>ctxIdxInc</code>
3	4	$(b_3 \neq 0) ? 5 : 6$
	5	$(b_3 \neq 0) ? 6 : 7$
14	2	$(b_1 \neq 1) ? 2 : 3$
17	4	$(b_3 \neq 0) ? 2 : 3$
27	2	$(b_1 \neq 0) ? 4 : 5$
32	4	$(b_3 \neq 0) ? 2 : 3$
36	2	$(b_1 \neq 0) ? 2 : 3$

9.3.3.1.3 Assignment process of `ctxIdxInc` for syntax elements `significant_coeff_flag`, `last_significant_coeff_flag`, and `coeff_abs_level_minus1`

Inputs to this process are `ctxIdxOffset` and `binIdx`.

Output of this process is `ctxIdxInc`.

The assignment process of `ctxIdxInc` for syntax elements `significant_coeff_flag`, `last_significant_coeff_flag`, and `coeff_abs_level_minus1` as well as for `coded_block_flag` depends on categories of different blocks denoted by the variable `ctxBlockCat`. The specification of these block categories is given in Table 9-33.

Table 9-33 – Specification of ctxBlockCat for the different blocks

Block description	maxNumCoeff	ctxBlockCat
block of luma DC transform coefficient levels (i.e., list Intra16x16DCLevel as described in subclause 7.4.5.3)	16	0
block of luma AC transform coefficient levels (i.e., list Intra16x16ACLevel[i] as described in subclause 7.4.5.3)	15	1
block of 16 luma transform coefficient levels (i.e., list LumaLevel[i] as described in subclause 7.4.5.3)	16	2
block of chroma DC transform coefficient levels	4 * NumC8x8	3
block of chroma AC transform coefficient levels	15	4
block of 64 luma transform coefficient levels (i.e., list LumaLevel8x8[i] as described in subclause 7.4.5.3)	64	5

Let the variable levelListIdx be set equal to the index of the list of transform coefficient levels as specified in subclause 7.4.5.3.

For the syntax elements significant_coeff_flag and last_significant_coeff_flag in blocks with ctxBlockCat < 5 and ctxBlockCat != 3, the variable ctxIdxInc is derived by

$$\text{ctxIdxInc} = \text{levelListIdx} \quad (9-15)$$

where levelListIdx ranges from 0 to maxNumCoeff – 2, inclusive.

For the syntax elements significant_coeff_flag and last_significant_coeff_flag in blocks with ctxBlockCat == 3, the variable ctxIdxInc is derived by

$$\text{ctxIdxInc} = \text{Min}(\text{levelListIdx} / \text{NumC8x8}, 2) \quad (9-16)$$

where levelListIdx ranges from 0 to 4 * NumC8x8 – 2, inclusive.

For the syntax elements significant_coeff_flag and last_significant_coeff_flag in 8x8 luma blocks with ctxBlockCat == 5, Table 9-34 contains the specification of ctxIdxInc for the given values of levelListIdx, where levelListIdx ranges from 0 to 62, inclusive.

Table 9-34 – Mapping of scanning position to ctxIdxInc for ctxBlockCat == 5

levelListIdx	ctxIdxInc for significant_coeff_flag (frame coded macroblocks)	ctxIdxInc for significant_coeff_flag (field coded macroblocks)	ctxIdxInc for last_significant_coeff_flag	levelListIdx	ctxIdxInc for significant_coeff_flag (frame coded macroblocks)	ctxIdxInc for significant_coeff_flag (field coded macroblocks)	ctxIdxInc for last_significant_coeff_flag
0	0	0	0	32	7	9	3
1	1	1	1	33	6	9	3
2	2	1	1	34	11	10	3
3	3	2	1	35	12	10	3
4	4	2	1	36	13	8	3
5	5	3	1	37	11	11	3
6	5	3	1	38	6	12	3
7	4	4	1	39	7	11	3
8	4	5	1	40	8	9	4
9	3	6	1	41	9	9	4
10	3	7	1	42	14	10	4
11	4	7	1	43	10	10	4
12	4	7	1	44	9	8	4
13	4	8	1	45	8	13	4
14	5	4	1	46	6	13	4
15	5	5	1	47	11	9	4
16	4	6	2	48	12	9	5
17	4	9	2	49	13	10	5
18	4	10	2	50	11	10	5
19	4	10	2	51	6	8	5
20	3	8	2	52	9	13	6
21	3	11	2	53	14	13	6
22	6	12	2	54	10	9	6
23	7	11	2	55	9	9	6
24	7	9	2	56	11	10	7
25	7	9	2	57	12	10	7
26	8	10	2	58	13	14	7
27	9	10	2	59	11	14	7
28	10	8	2	60	14	14	8
29	9	11	2	61	10	14	8
30	8	12	2	62	12	14	8
31	7	11	2				

Let numDecodAbsLevelEq1 denotes the accumulated number of decoded transform coefficient levels with absolute value equal to 1, and let numDecodAbsLevelGt1 denotes the accumulated number of decoded transform coefficient levels with absolute value greater than 1. Both numbers are related to the same transform coefficient block, where the current decoding process takes place. Then, for decoding of coeff_abs_level_minus1, ctxIdxInc for coeff_abs_level_minus1 is specified depending on binIdx as follows.

- If binIdx is equal to 0, ctxIdxInc is derived by

$$\text{ctxIdxInc} = ((\text{numDecodAbsLevelGt1} \neq 0) ? 0 : \text{Min}(4, 1 + \text{numDecodAbsLevelEq1})) \quad (9-17)$$

- Otherwise (binIdx is greater than 0), ctxIdxInc is derived by

$$\text{ctxIdxInc} = 5 + \text{Min}(4 - (\text{ctxBlockCat} == 3), \text{numDecodAbsLevelGt1}) \quad (9-18)$$

9.3.3.2 Arithmetic decoding process

Inputs to this process are the bypassFlag, ctxIdx as derived in subclause 9.3.3.1, and the state variables codIRange and codIOffset of the arithmetic decoding engine.

Output of this process is the value of the bin.

Figure 9-2 illustrates the whole arithmetic decoding process for a single bin. For decoding the value of a bin, the context index ctxIdx is passed to the arithmetic decoding process DecodeBin(ctxIdx), which is specified as follows.

- If bypassFlag is equal to 1, DecodeBypass() as specified in subclause 9.3.3.2.3 is invoked.
- Otherwise, if bypassFlag is equal to 0 and ctxIdx is equal to 276, DecodeTerminate() as specified in subclause 9.3.3.2.4 is invoked.
- Otherwise (bypassFlag is equal to 0 and ctxIdx is not equal to 276), DecodeDecision() as specified in subclause 9.3.3.2.1 shall be applied.

Figure 9-2 – Overview of the arithmetic decoding process for a single bin (informative)

NOTE - Arithmetic coding is based on the principle of recursive interval subdivision. Given a probability estimation $p(0)$ and $p(1) = 1 - p(0)$ of a binary decision (0, 1), an initially given code sub-interval with the range codIRange will be subdivided into two sub-intervals having range $p(0) * \text{codIRange}$ and $\text{codIRange} - p(0) * \text{codIRange}$, respectively. Depending on the decision, which has been observed, the corresponding sub-interval will be chosen as the new code interval, and a binary code string pointing into that interval will represent the sequence of observed binary decisions. It is useful to distinguish between the most probable symbol (MPS) and the least probable symbol (LPS), so that binary decisions have to be identified as either MPS or LPS, rather than 0 or 1. Given this terminology, each context is specified by the probability p_{LPS} of the LPS and the value of MPS (valMPS), which is either 0 or 1.

The arithmetic core engine in this Recommendation | International Standard has three distinct properties:

- The probability estimation is performed by means of a finite-state machine with a table-based transition process between 64 different representative probability states $\{p_{LPS}(pStateIdx) | 0 \leq pStateIdx < 64\}$ for the LPS probability p_{LPS} . The numbering of the states is arranged in such a way that the probability state with index $pStateIdx = 0$ corresponds to an LPS probability value of 0.5, with decreasing LPS probability towards higher state indices.
- The range $codIRange$ representing the state of the coding engine is quantised to a small set $\{Q_1, \dots, Q_4\}$ of pre-set quantisation values prior to the calculation of the new interval range. Storing a table containing all 64×4 pre-computed product values of $Q_i * p_{LPS}(pStateIdx)$ allows a multiplication-free approximation of the product $codIRange * p_{LPS}(pStateIdx)$.
- For syntax elements or parts thereof for which an approximately uniform probability distribution is assumed to be given a separate simplified encoding and decoding bypass process is used.

9.3.3.2.1 Arithmetic decoding process for a binary decision

Inputs to this process are $ctxIdx$, $codIRange$, and $codIOffset$.

Outputs of this process are the decoded value $binVal$, and the updated variables $codIRange$ and $codIOffset$.

Figure 9-3 shows the flowchart for decoding a single decision (DecodeDecision).

1. The value of the variable $codIRangeLPS$ is derived as follows.

- Given the current value of $codIRange$, the variable $qCodIRangeIdx$ is derived by

$$qCodIRangeIdx = (codIRange \gg 6) \& 0x03 \quad (9-19)$$

- Given $qCodIRangeIdx$ and $pStateIdx$ associated with $ctxIdx$, the value of the variable $rangeTabLPS$ as specified in Table 9-35 is assigned to $codIRangeLPS$:

$$codIRangeLPS = rangeTabLPS[pStateIdx][qCodIRangeIdx] \quad (9-20)$$

2. The variable $codIRange$ is set equal to $codIRange - codIRangeLPS$ and the following applies.

- If $codIOffset$ is greater than or equal to $codIRange$, the variable $binVal$ is set equal to $1 - valMPS$, $codIOffset$ is decremented by $codIRange$, and $codIRange$ is set equal to $codIRangeLPS$.
- Otherwise, the variable $binVal$ is set equal to $valMPS$.

Given the value of $binVal$, the state transition is performed as specified in subclause 9.3.3.2.1.1. Depending on the current value of $codIRange$, renormalization is performed as specified in subclause 9.3.3.2.2.

9.3.3.2.1.1 State transition process

Inputs to this process are the current $pStateIdx$, the decoded value $binVal$ and $valMPS$ values of the context variable associated with $ctxIdx$.

Outputs of this process are the updated $pStateIdx$ and $valMPS$ of the context variable associated with $ctxIdx$.

Depending on the decoded value $binVal$, the update of the two variables $pStateIdx$ and $valMPS$ associated with $ctxIdx$ is derived as follows:

```

if( binVal == valMPS )
    pStateIdx = transIdxMPS( pStateIdx )
else {
    if( pStateIdx == 0 )
        valMPS = 1 - valMPS
    pStateIdx = transIdxLPS( pStateIdx )
}

```

(9-21)

Table 9-36 specifies the transition rules $transIdxMPS()$ and $transIdxLPS()$ after decoding the value of $valMPS$ and $1 - valMPS$, respectively.

Figure 9-3 – Flowchart for decoding a decision

Table 9-35 – Specification of rangeTabLPS depending on pStateIdx and qCodIRangeIdx

pStateIdx	qCodIRangeIdx				pStateIdx	qCodIRangeIdx			
	0	1	2	3		0	1	2	3
0	128	176	208	240	32	27	33	39	45

9.3.3.2.2 Renormalization process in the arithmetic decoding engine

Inputs to this process are bits from slice data and the variables `codIRange` and `codIOffset`.

Outputs of this process are the updated variables `codIRange` and `codIOffset`.

A flowchart of the renormalization is shown in Figure 9-4. The current value of `codIRange` is first compared to 0x0100 and further steps are specified as follows.

- If `codIRange` is greater than or equal to 0x0100, no renormalization is needed and the RenormD process is finished;
- Otherwise (`codIRange` is less than 0x0100), the renormalization loop is entered. Within this loop, the value of `codIRange` is doubled, i.e., left-shifted by 1 and a single bit is shifted into `codIOffset` by using `read_bits(1)`.

The bitstream shall not contain data that results in a value of `codIOffset` being greater than or equal to `codIRange` upon completion of this process.

Figure 9-4 – Flowchart of renormalization

9.3.3.2.3 Bypass decoding process for binary decisions

Inputs to this process are bits from slice data and the variables `codIRange` and `codIOffset`.

Outputs of this process are the updated variable `codIOffset` and the decoded value `binVal`.

The bypass decoding process is invoked when `bypassFlag` is equal to 1. Figure 9-5 shows a flowchart of the corresponding process.

First, the value of `codIOffset` is doubled, i.e., left-shifted by 1 and a single bit is shifted into `codIOffset` by using `read_bits( 1 )`. Then, the value of `codIOffset` is compared to the value of `codIRange` and further steps are specified as follows.

- If `codIOffset` is greater than or equal to `codIRange`, the variable `binVal` is set equal to 1 and `codIOffset` is decremented by `codIRange`.
- Otherwise (`codIOffset` is less than `codIRange`), the variable `binVal` is set equal to 0.

The bitstream shall not contain data that results in a value of `codIOffset` being greater than or equal to `codIRange` upon completion of this process.

Figure 9-5— Flowchart of bypass decoding process

9.3.3.2.4 Decoding process for binary decisions before termination

Inputs to this process are bits from slice data and the variables `codIRange` and `codIOffset`.

Outputs of this process are the updated variables `codIRange` and `codIOffset`, and the decoded value `binVal`.

This special decoding routine applies to decoding of `end_of_slice_flag` and of the bin indicating the `I_PCM` mode corresponding to `ctxIdx` equal to 276. Figure 9-6 shows the flowchart of the corresponding decoding process, which is specified as follows.

First, the value of `codIRange` is decremented by 2. Then, the value of `codIOffset` is compared to the value of `codIRange` and further steps are specified as follows.

- If `codIOffset` is greater than or equal to `codIRange`, the variable `binVal` is set equal to 1, no renormalization is carried out, and CABAC decoding is terminated. The last bit inserted in register `codIOffset` is equal to 1. When decoding `end_of_slice_flag`, this last bit inserted in register `codIOffset` is interpreted as `rbsp_stop_one_bit`.
- Otherwise (`codIOffset` is less than `codIRange`), the variable `binVal` is set equal to 0 and renormalization is performed as specified in subclause 9.3.3.2.2.

NOTE – This procedure may also be implemented using `DecodeDecision(ctxIdx)` with `ctxIdx = 276`. In the case where the decoded value is equal to 1, seven more bits would be read by `DecodeDecision(ctxIdx)` and a decoding process would have to adjust its bitstream pointer accordingly to properly decode following syntax elements.

Figure 9-6 – Flowchart of decoding a decision before termination

9.3.4 Arithmetic encoding process (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

Inputs to this process are decisions that are to be encoded and written.

Outputs of this process are bits that are written to the RBSP.

This informative subclause describes an arithmetic encoding engine that matches the arithmetic decoding engine described in subclause 9.3.3.2. The encoding engine is essentially symmetric with the decoding engine, i.e., procedures are called in the same order. The following procedures are described in this section: InitEncoder, EncodeDecision, EncodeBypass, EncodeTerminate, which correspond to InitDecoder, DecodeDecision, DecodeBypass, and DecodeTerminate, respectively. The state of the arithmetic encoding engine is represented by a value of the variable codILow pointing to the lower end of a sub-interval and a value of the variable codIRange specifying the corresponding range of that sub-interval.

9.3.4.1 Initialisation process for the arithmetic encoding engine (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

This process is invoked before encoding the first macroblock of a slice, and after encoding any pcm_alignment_zero_bit and all pcm_sample_luma and pcm_sample_chroma data for a macroblock of type I_PCM.

Outputs of this process are the values codILow, codIRange, firstBitFlag, bitsOutstanding, and symCnt of the arithmetic encoding engine.

In the initialisation procedure of the encoder, codILow is set equal to 0, and codIRange is set equal to 0x01FE. Furthermore, a firstBitFlag is set equal to 1, and bitsOutstanding and symCnt counters are set equal to 0.

NOTE – The minimum register precision required for codILow is 10 bits and for CodIRange is 9 bits. The precision required for the counters bitsOutstanding and symCnt should be sufficiently large to prevent overflow of the related registers. When MaxBinCountInSlice denotes the maximum total number of binary decisions to encode in one slice, the minimum register precision required for the variables bitsOutstanding and symCnt is given by $\text{Ceil}(\text{Log}_2(\text{MaxBinCountInSlice} + 1))$.

9.3.4.2 Encoding process for a binary decision (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

Inputs to this process are the context index ctxIdx, the value of binVal to be encoded, and the variables codIRange, codILow and symCnt.

Outputs of this process are the variables codIRange, codILow, and symCnt.

Figure 9-7 shows the flowchart for encoding a single decision. In a first step, the variable codIRangeLPS is derived as follows.

Given the current value of codIRange , codIRange is mapped to the index qCodIRangeIdx of a quantised value of codIRange by using Equation 9-19. The value of qCodIRangeIdx and the value of pStateIdx associated with ctxIdx are used to determine the value of the variable rangeTabLPS as specified in Table 9-35, which is assigned to codIRangeLPS . The value of $\text{codIRange} - \text{codIRangeLPS}$ is assigned to codIRange .

In a second step, the value of binVal is compared to valMPS associated with ctxIdx . When binVal is different from valMPS , codIRange is added to codILow and codIRange is set equal to the value codIRangeLPS . Given the encoded decision, the state transition is performed as specified in subclause 9.3.3.2.1.1. Depending on the current value of codIRange , renormalization is performed as specified in subclause 9.3.4.3. Finally, the variable symCnt is incremented by 1.

Figure 9-7 – Flowchart for encoding a decision

9.3.4.3 Renormalization process in the arithmetic encoding engine (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

Inputs to this process are the variables codIRange , codILow , firstBitFlag , and bitsOutstanding .

Outputs of this process are zero or more bits written to the RBSP and the updated variables codIRange , codILow , firstBitFlag , and bitsOutstanding .

Renormalization is illustrated in Figure 9-8.

Figure 9-8 – Flowchart of renormalization in the encoder

The PutBit() procedure described in Figure 9-9 provides carry over control. It uses the function WriteBits(B, N) that writes N bits with value B to the bitstream and advances the bitstream pointer by N bit positions. This function assumes the existence of a bitstream pointer with an indication of the position of the next bit to be written to the bitstream by the encoding process.

Figure 9-9 – Flowchart of PutBit(B)

9.3.4.4 Bypass encoding process for binary decisions (informative)

This subclause does not form an integral part of this Recommendation / International Standard.

Inputs to this process are the variables **binVal**, **codILow**, **codIRange**, **bitsOutstanding**, and **symCnt**.

Output of this process is a bit written to the RBSP and the updated variables **codILow**, **bitsOutstanding**, and **symCnt**.

This encoding process applies to all binary decisions with **bypassFlag** equal to 1. Renormalization is included in the specification of this process as given in Figure 9-10.

Figure 9-10 – Flowchart of encoding bypass

9.3.4.5 Encoding process for a binary decision before termination (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

Inputs to this process are the variables `binVal`, `codIRange`, `codILow`, `bitsOutstanding`, and `symCnt`.

Outputs of this process are zero or more bits written to the RBSP and the updated variables `codILow`, `codIRange`, `bitsOutstanding`, and `symCnt`.

This encoding routine shown in Figure 9-11 applies to encoding of the `end_of_slice_flag` and of the bin indicating the `I_PCM mb_type` both associated with `ctxIdx` equal to 276.

Figure 9-11 – Flowchart of encoding a decision before termination

When the value of binVal to encode is equal to 1, CABAC encoding is terminated and the flushing procedure shown in Figure 9-12 is applied. In this flushing procedure, the last bit written by WriteBits(B, N) is equal to 1. When encoding end_of_slice_flag, this last bit is interpreted as the rbsp_stop_one bit.

Figure 9-12 – Flowchart of flushing at termination

9.3.4.6 Byte stuffing process (informative)

This subclause does not form an integral part of this Recommendation | International Standard.

This process is invoked after encoding the last macroblock of the last slice of a picture and after encapsulation.

Inputs to this process are the number of bytes `NumBytesInVclNALunits` of all VCL NAL units of a picture, the number of macroblocks `PicSizeInMbs` in the picture, and the number of binary symbols `BinCountsInNALunits` resulting from encoding the contents of all VCL NAL units of the picture.

Outputs of this process are zero or more bytes appended to the NAL unit.

Let the variable `k` be set equal to $\text{Ceil} (\text{Ceil} (3 * (32 * \text{BinCountsInNALunits} - \text{RawMbBits} * \text{PicSizeInMbs}) \div 1024) - \text{NumBytesInVclNALunits}) \div 3)$. Depending on the variable `k` the following applies.

- If `k` is less than or equal to 0, no `cabac_zero_word` is appended to the NAL unit.
- Otherwise (`k` is greater than 0), the 3-byte sequence `0x000003` is appended `k` times to the NAL unit after encapsulation, where the first two bytes `0x0000` represent a `cabac_zero_word` and the third byte `0x03` represents an `emulation_prevention_three_byte`.

Annex A Profiles and levels

(This annex forms an integral part of this Recommendation | International Standard)

Profiles and levels specify restrictions on bitstreams and hence limits on the capabilities needed to decode the bitstreams. Profiles and levels may also be used to indicate interoperability points between individual decoder implementations.

NOTE - This Recommendation | International Standard does not include individually selectable “options” at the decoder, as this would increase interoperability difficulties.

Each profile specifies a subset of algorithmic features and limits that shall be supported by all decoders conforming to that profile.

NOTE – Encoders are not required to make use of any particular subset of features supported in a profile.

Each level specifies a set of limits on the values that may be taken by the syntax elements of this Recommendation | International Standard. The same set of level definitions is used with all profiles, but individual implementations may support a different level for each supported profile. For any given profile, levels generally correspond to decoder processing load and memory capability.

A.1 Requirements on video decoder capability

Capabilities of video decoders conforming to this Recommendation | International Standard are specified in terms of the ability to decode video streams conforming to the constraints of profiles and levels specified in this Annex. For each such profile, the level supported for that profile shall also be expressed.

Specific values are specified in this annex for the syntax elements `profile_idc` and `level_idc`. All other values of `profile_idc` and `level_idc` are reserved for future use by ITU-T | ISO/IEC.

NOTE - Decoders should not infer that when a reserved value of `profile_idc` or `level_idc` falls between the values specified in this Recommendation | International Standard that this indicates intermediate capabilities between the specified profiles or levels, as there are no restrictions on the method to be chosen by ITU-T | ISO/IEC for the use of such future reserved values.

A.2 Profiles

A.2.1 Baseline profile

Bitstreams conforming to the Baseline profile shall obey the following constraints:

- Only I and P slice types may be present.
- NAL unit streams shall not contain `nal_unit_type` values in the range of 2 to 4, inclusive.
- Sequence parameter sets shall have `frame_mbs_only_flag` equal to 1.
- The syntax elements `chroma_format_idc`, `bit_depth_luma_minus8`, `bit_depth_chroma_minus8`, `qprime_y_zero_transform_bypass_flag`, and `seq_scaling_matrix_present_flag` shall not be present in sequence parameter sets.
- Picture parameter sets shall have `weighted_pred_flag` and `weighted_bipred_idc` both equal to 0.
- Picture parameter sets shall have `entropy_coding_mode_flag` equal to 0.
- Picture parameter sets shall have `num_slice_groups_minus1` in the range of 0 to 7, inclusive.
- The syntax elements `transform_8x8_mode_flag`, `pic_scaling_matrix_present_flag`, and `second_chroma_qp_index_offset` shall not be present in picture parameter sets.
- The syntax element `level_prefix` shall not be greater than 15.
- The level constraints specified for the Baseline profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the Baseline profile is specified by `profile_idc` being equal to 66.

Decoders conforming to the Baseline profile at a specific level shall be capable of decoding all bitstreams in which `profile_idc` is equal to 66 or `constraint_set0_flag` is equal to 1 and in which `level_idc` and `constraint_set3_flag` represent a level less than or equal to the specified level.

A.2.2 Main profile

Bitstreams conforming to the Main profile shall obey the following constraints:

- Only I, P, and B slice types may be present.
- NAL unit streams shall not contain `nal_unit_type` values in the range of 2 to 4, inclusive.
- Arbitrary slice order is not allowed.
- The syntax elements `chroma_format_idc`, `bit_depth_luma_minus8`, `bit_depth_chroma_minus8`, `qpprime_y_zero_transform_bypass_flag`, and `seq_scaling_matrix_present_flag` shall not be present in sequence parameter sets.
- Picture parameter sets shall have `num_slice_groups_minus1` equal to 0 only.
- Picture parameter sets shall have `redundant_pic_cnt_present_flag` equal to 0 only.
- The syntax elements `transform_8x8_mode_flag`, `pic_scaling_matrix_present_flag`, and `second_chroma_qp_index_offset` shall not be present in picture parameter sets.
- The syntax element `level_prefix` shall not be greater than 15 (when present).
- The level constraints specified for the Main profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the Main profile is specified by `profile_idc` being equal to 77.

Decoders conforming to the Main profile at a specified level shall be capable of decoding all bitstreams in which `profile_idc` is equal to 77 or `constraint_set1_flag` is equal to 1 and in which `level_idc` and `constraint_set3_flag` represent a level less than or equal to the specified level.

A.2.3 Extended profile

Bitstreams conforming to the Extended profile shall obey the following constraints:

- Sequence parameter sets shall have `direct_8x8_inference_flag` equal to 1.
- The syntax elements `chroma_format_idc`, `bit_depth_luma_minus8`, `bit_depth_chroma_minus8`, `qpprime_y_zero_transform_bypass_flag`, and `seq_scaling_matrix_present_flag` shall not be present in sequence parameter sets.
- Picture parameter sets shall have `entropy_coding_mode_flag` equal to 0.
- Picture parameter sets shall have `num_slice_groups_minus1` in the range of 0 to 7, inclusive.
- The syntax elements `transform_8x8_mode_flag`, `pic_scaling_matrix_present_flag`, and `second_chroma_qp_index_offset` shall not be present in picture parameter sets.
- The syntax element `level_prefix` shall not be greater than 15 (when present).
- The level constraints specified for the Extended profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the Extended profile is specified by `profile_idc` being equal to 88.

Decoders conforming to the Extended profile at a specified level shall be capable of decoding all bitstreams in which `profile_idc` is equal to 88 or `constraint_set2_flag` is equal to 1 and in which `level_idc` represents a level less than or equal to specified level.

Decoders conforming to the Extended profile at a specified level shall also be capable of decoding all bitstreams in which `profile_idc` is equal to 66 or `constraint_set0_flag` is equal to 1, in which `level_idc` and `constraint_set3_flag` represent a level less than or equal to the specified level.

A.2.4 High profile

Bitstreams conforming to the High profile shall obey the following constraints:

- Only I, P, and B slice types may be present.
- NAL unit streams shall not contain `nal_unit_type` values in the range of 2 to 4, inclusive.
- Arbitrary slice order is not allowed.

- Picture parameter sets shall have `num_slice_groups_minus1` equal to 0 only.
- Picture parameter sets shall have `redundant_pic_cnt_present_flag` equal to 0 only.
- Sequence parameter sets shall have `chroma_format_idc` in the range of 0 to 1 inclusive.
- Sequence parameter sets shall have `bit_depth_luma_minus8` equal to 0 only.
- Sequence parameter sets shall have `bit_depth_chroma_minus8` equal to 0 only.
- Sequence parameter sets shall have `qpprime_y_zero_transform_bypass_flag` equal to 0 only.
- The level constraints specified for the High profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the High profile is specified by `profile_idc` being equal to 100. Decoders conforming to the High profile at a specific level shall be capable of decoding all bitstreams in which `level_idc` and `constraint_set3_flag` represents a level less than or equal to the specified level and either or both of the following conditions are true:

- `profile_idc` is equal to 77 or 100, or
- `constraint_set1_flag` is equal to 1.

A.2.5 High 10 profile

Bitstreams conforming to the High 10 profile shall obey the following constraints:

- Only I, P, and B slice types may be present.
- NAL unit streams shall not contain `nal_unit_type` values in the range of 2 to 4, inclusive.
- Arbitrary slice order is not allowed.
- Picture parameter sets shall have `num_slice_groups_minus1` equal to 0 only.
- Picture parameter sets shall have `redundant_pic_cnt_present_flag` equal to 0 only.
- Sequence parameter sets shall have `chroma_format_idc` in the range of 0 to 1 inclusive.
- Sequence parameter sets shall have `bit_depth_luma_minus8` in the range of 0 to 2 inclusive.
- Sequence parameter sets shall have `bit_depth_chroma_minus8` in the range of 0 to 2 inclusive.
- Sequence parameter sets shall have `qpprime_y_zero_transform_bypass_flag` equal to 0 only.
- The level constraints specified for the High 10 profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the High 10 profile is specified by `profile_idc` being equal to 110. Decoders conforming to the High 10 profile at a specific level shall be capable of decoding all bitstreams in which `level_idc` and `constraint_set3_flag` represent a level less than or equal to the specified level and either or both of the following conditions are true:

- `profile_idc` is equal to 77, 100, or 110, or
- `constraint_set1_flag` is equal to 1.

A.2.6 High 4:2:2 profile

Bitstreams conforming to the High 4:2:2 profile shall obey the following constraints:

- Only I, P, and B slice types may be present.
- NAL unit streams shall not contain `nal_unit_type` values in the range of 2 to 4, inclusive.
- Arbitrary slice order is not allowed.
- Picture parameter sets shall have `num_slice_groups_minus1` equal to 0 only.
- Picture parameter sets shall have `redundant_pic_cnt_present_flag` equal to 0 only.
- Sequence parameter sets shall have `chroma_format_idc` in the range of 0 to 2 inclusive.
- Sequence parameter sets shall have `bit_depth_luma_minus8` in the range of 0 to 2 inclusive.
- Sequence parameter sets shall have `bit_depth_chroma_minus8` in the range of 0 to 2 inclusive.
- Sequence parameter sets shall have `qpprime_y_zero_transform_bypass_flag` equal to 0 only.
- The level constraints specified for the High 4:2:2 profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the High 4:2:2 profile is specified by profile_idc being equal to 122. Decoders conforming to the High 4:2:2 profile at a specific level shall be capable of decoding all bitstreams in which level_idc and constraint_set3_flag represents a level less than or equal to the specified level and either or both of the following conditions are true:

- profile_idc is equal to 77, 100, 110, or 122, or
- constraint_set1_flag is equal to 1.

A.2.7 High 4:4:4 profile

Bitstreams conforming to the High 4:4:4 profile shall obey the following constraints:

- Only I, P, and B slice types may be present.
- NAL unit streams shall not contain nal_unit_type values in the range of 2 to 4, inclusive.
- Arbitrary slice order is not allowed.
- Picture parameter sets shall have num_slice_groups_minus1 equal to 0 only.
- Picture parameter sets shall have redundant_pic_cnt_present_flag equal to 0 only.
- Sequence parameter sets shall have bit_depth_luma_minus8 in the range of 0 to 4 inclusive.
- Sequence parameter sets shall have bit_depth_chroma_minus8 in the range of 0 to 4 inclusive.
- The level constraints specified for the High 4:4:4 profile in subclause A.3 shall be fulfilled.

Conformance of a bitstream to the High 4:4:4 profile is specified by profile_idc being equal to 144. Decoders conforming to the High 4:4:4 profile at a specific level shall be capable of decoding all bitstreams in which level_idc and constraint_set3_flag represent a level less than or equal to the specified level and either or both of the following conditions are true:

- profile_idc is equal to 77, 100, 110, 122, or 144, or
- constraint_set1_flag is equal to 1.

A.3 Levels

The following is specified for expressing the constraints in this Annex.

- Let access unit n be the n-th access unit in decoding order with the first access unit being access unit 0.
- Let picture n be the primary coded picture or the corresponding decoded picture of access unit n.

A.3.1 Level limits common to the Baseline, Main, and Extended profiles

Let the variable fR be derived as follows.

- If picture n is a frame, fR is set equal to $1 \div 172$.
- Otherwise (picture n is a field), fR is set equal to $1 \div (172 * 2)$.

Bitstreams conforming to the Baseline, Main, or Extended profiles at a specified level shall obey the following constraints:

- a) The nominal removal time of access unit n (with $n > 0$) from the CPB as specified in subclause C.1.2, satisfies the constraint that $t_{r,n}(n) - t_r(n-1)$ is greater than or equal to $\text{Max}(\text{PicSizeInMbs} \div \text{MaxMBPS}, fR)$, where MaxMBPS is the value specified in Table A-1 that applies to picture n – 1, and PicSizeInMbs is the number of macroblocks in picture n – 1.
- b) The difference between consecutive output times of pictures from the DPB as specified in subclause C.2.2, satisfies the constraint that $\Delta t_{o,dpb}(n) \geq \text{Max}(\text{PicSizeInMbs} \div \text{MaxMBPS}, fR)$, where MaxMBPS is the value specified in Table A-1 for picture n, and PicSizeInMbs is the number of macroblocks of picture n, provided that picture n is a picture that is output and is not the last picture of the bitstream that is output.
- c) The sum of the NumBytesInNALunit variables for access unit 0 is less than or equal to $384 * (\text{PicSizeInMbs} + \text{MaxMBPS} * (t_r(0) - t_{r,n}(0))) \div \text{MinCR}$, where MaxMBPS and MinCR are the values specified in Table A-1 that apply to picture 0 and PicSizeInMbs is the number of macroblocks in picture 0.

- d) The sum of the NumBytesInNALunit variables for access unit n (with $n > 0$) is less than or equal to $384 * \text{MaxMBPS} * (t_r(n) - t_r(n-1)) \div \text{MinCR}$, where MaxMBPS and MinCR are the values specified in Table A-1 that apply to picture n .
- e) $\text{PicWidthInMbs} * \text{FrameHeightInMbs} \leq \text{MaxFS}$, where MaxFS is specified in Table A-1
- f) $\text{PicWidthInMbs} \leq \text{Sqrt}(\text{MaxFS} * 8)$
- g) $\text{FrameHeightInMbs} \leq \text{Sqrt}(\text{MaxFS} * 8)$
- h) $\text{max_dec_frame_buffering} \leq \text{MaxDpbSize}$, where MaxDpbSize is equal to $\text{Min}(1024 * \text{MaxDPB} / (\text{PicWidthInMbs} * \text{FrameHeightInMbs} * 384), 16)$ and MaxDPB is given in Table A-1 in units of 1024 bytes.
- i) For the VCL HRD parameters, $\text{BitRate}[\text{SchedSelIdx}] \leq 1000 * \text{MaxBR}$ and $\text{CpbSize}[\text{SchedSelIdx}] \leq 1000 * \text{MaxCPB}$ for at least one value of SchedSelIdx, where BitRate[SchedSelIdx] is given by Equation E-37 and CpbSize[SchedSelIdx] is given by Equation E-38 when vcl_hrd_parameters_present_flag is equal to 1. MaxBR and MaxCPB are specified in Table A-1 in units of 1000 bits/s and 1000 bits, respectively. The bitstream shall satisfy these conditions for at least one value of SchedSelIdx in the range 0 to cpb_cnt_minus1, inclusive.
- j) For the NAL HRD parameters, $\text{BitRate}[\text{SchedSelIdx}] \leq 1200 * \text{MaxBR}$ and $\text{CpbSize}[\text{SchedSelIdx}] \leq 1200 * \text{MaxCPB}$ for at least one value of SchedSelIdx, where BitRate[SchedSelIdx] is given by Equation E-37 and CpbSize[SchedSelIdx] is given by Equation E-38 when nal_hrd_parameters_present_flag equal to 1. MaxBR and MaxCPB are specified in Table A-1 in units of 1200 bits/s and 1200 bits, respectively. The bitstream shall satisfy these conditions for at least one value of SchedSelIdx in the range 0 to cpb_cnt_minus1.
- k) Vertical motion vector component range luma motion vectors does not exceed MaxVmvR in units of luma frame samples, where MaxVmvR is specified in Table A-1
 NOTE – When chroma_format_idc is equal to 1 and the current macroblock is a field macroblock, the motion vector component range for chroma motion vectors may exceed MaxVmvR in units of luma frame samples, due to the method of deriving chroma motion vectors as specified in subclause 8.4.1.4.
- l) Horizontal motion vector range does not exceed the range of -2048 to 2047.75, inclusive, in units of luma samples
- m) Number of motion vectors per two consecutive macroblocks in decoding order (also applying to the total from the last macroblock of a slice and the first macroblock of the next slice in decoding order, and in particular also applying to the total from the last macroblock of the last slice of a picture and the first macroblock of the first slice of the next picture in decoding order) does not exceed MaxMvsPer2Mb, where MaxMvsPer2Mb is specified in Table A-1. The number of motion vectors for each macroblock is the value of the variable MvCnt after the completion of the intra or inter prediction process for the macroblock.
- n) Number of bits of macroblock_layer() data for any macroblock is not greater than 3200. Depending on entropy_coding_mode_flag, the bits of macroblock_layer() data are counted as follows.
- If entropy_coding_mode_flag is equal to 0, the number of bits of macroblock_layer() data is given by the number of bits in the macroblock_layer() syntax structure for a macroblock.
 - Otherwise (entropy_coding_mode_flag is equal to 1), the number of bits of macroblock_layer() data for a macroblock is given by the number of times read_bits(1) is called in subclauses 9.3.3.2.2 and 9.3.3.2.3 when parsing the macroblock_layer() associated with the macroblock.

Table A-1 specifies the limits for each level. Entries marked "-" in Table A-1 denote the absence of a corresponding limit. For purposes of comparison of level capabilities, a level shall be considered to be a lower (higher) level than some other level if the level appears nearer to the top (bottom) row of Table A-1 than the other level.

A level to which the bitstream conforms shall be indicated by the syntax elements level_idc and constraint_set3_flag as follows.

- If level_idc is equal to 11 and constraint_set3_flag is equal to 1, the indicated level is level 1b.
- Otherwise (level_idc is not equal to 11 or constraint_set3_flag is not equal to 1), level_idc shall be set equal to a value of ten times the level number specified in Table A-1 and constraint_set3_flag shall be set equal to 0.

Table A-1 – Level limits

Level number	Max macroblock processing rate MaxMBPS (MB/s)	Max frame size MaxFS (MBs)	Max decoded picture buffer size MaxDPB (1024 bytes for 4:2:0)	Max video bit rate MaxBR (1000 bits/s, 1200 bits/s, cpbBrVclFactor bits/s, or cpbBrNalFactor bits/s)	Max CPB size MaxCPB (1000 bits, 1200 bits, cpbBrVclFactor bits, or cpbBrNalFactor bits)	Vertical MV component range MaxVmvR (luma frame samples)	Min compression ratio MinCR	Max number of motion vectors per two consecutive MBs MaxMvsPer2Mb
1	1 485	99	148.5	64	175	[-64,+63.75]	2	
1b	1 485	99	148.5	128	350	[-64,+63.75]	2	
1.1	3 000	396	337.5	192	500	[-128,+127.75]	2	-
1.2	6 000	396	891.0	384	1 000	[-128,+127.75]	2	-
1.3	11 880	396	891.0	768	2 000	[-128,+127.75]	2	-
2	11 880	396	891.0	2 000	2 000	[-128,+127.75]	2	-
2.1	19 800	792	1 782.0	4 000	4 000	[-256,+255.75]	2	-
2.2	20 250	1 620	3 037.5	4 000	4 000	[-256,+255.75]	2	-
3	40 500	1 620	3 037.5	10 000	10 000	[-256,+255.75]	2	32
3.1	108 000	3 600	6 750.0	14 000	14 000	[-512,+511.75]	4	16
3.2	216 000	5 120	7 680.0	20 000	20 000	[-512,+511.75]	4	16
4	245 760	8 192	12 288.0	20 000	25 000	[-512,+511.75]	4	16
4.1	245 760	8 192	12 288.0	50 000	62 500	[-512,+511.75]	2	16
4.2	522 240	8 704	13 056.0	50 000	62 500	[-512,+511.75]	2	16
5	589 824	22 080	41 400.0	135 000	135 000	[-512,+511.75]	2	16
5.1	983 040	36 864	69 120.0	240 000	240 000	[-512,+511.75]	2	16

Levels with non-integer level numbers in Table A-1 are referred to as “intermediate levels”.

NOTE – All levels have the same status, but some applications may choose to use only the integer-numbered levels.

Informative subclause A.3.4 shows the effect of these limits on frame rates for several example picture formats.

A.3.2 Level limits common to the High, High 10, High 4:2:2, and High 4:4:4 profiles

Let the variable fR be derived as follows.

- If picture n is a frame, fR is set equal to $1 \div 172$.
- Otherwise (picture n is a field), fR is set equal to $1 \div (172 * 2)$.

Bitstreams conforming to the High, High 10, High 4:2:2, or High 4:4:4 profiles at a specified level shall obey the following constraints:

- a) The nominal removal time of access unit n (with $n > 0$) from the CPB as specified in subclause C.1.2, satisfies the constraint that $t_{r,n}(n) - t_r(n-1)$ is greater than or equal to $\text{Max}(\text{PicSizeInMbs} \div \text{MaxMBPS}, \text{fR})$, where MaxMBPS is the value specified in Table A-1 that applies to picture n – 1, and PicSizeInMbs is the number of macroblocks in picture n – 1.
- b) The difference between consecutive output times of pictures from the DPB as specified in subclause C.2.2, satisfies the constraint that $\Delta t_{o,dpb}(n) \geq \text{Max}(\text{PicSizeInMbs} \div \text{MaxMBPS}, \text{fR})$, where MaxMBPS is the value specified in Table A-1 for picture n, and PicSizeInMbs is the number of macroblocks of picture n, provided that picture n is a picture that is output and is not the last picture of the bitstream that is output.

- c) $\text{PicWidthInMbs} * \text{FrameHeightInMbs} \leq \text{MaxFS}$, where MaxFS is specified in Table A-1
- d) $\text{PicWidthInMbs} \leq \text{Sqrt}(\text{MaxFS} * 8)$
- e) $\text{FrameHeightInMbs} \leq \text{Sqrt}(\text{MaxFS} * 8)$
- f) $\text{max_dec_frame_buffering} \leq \text{MaxDpbSize}$, where MaxDpbSize is equal to $\text{Min}(1024 * \text{MaxDPB} / (\text{PicWidthInMbs} * \text{FrameHeightInMbs} * 384), 16)$ and MaxDPB is specified in Table A-1.
- g) Vertical motion vector component range does not exceed MaxVmvR in units of luma frame samples, where MaxVmvR is specified in Table A-1.
- h) Horizontal motion vector range does not exceed the range of -2048 to 2047.75, inclusive, in units of luma samples.
- i) Number of motion vectors per two consecutive macroblocks in decoding order (also applying to the total from the last macroblock of a slice and the first macroblock of the next slice in decoding order) does not exceed MaxMvsPer2Mb, where MaxMvsPer2Mb is specified in Table A-1. The number of motion vectors for each macroblock is value of the variable MvCnt after the completion of the intra or inter prediction process for the macroblock.
- j) Number of bits of macroblock_layer() data for any macroblock is not greater than $128 + \text{RawMbBits}$. Depending on entropy_coding_mode_flag, the bits of macroblock_layer() data are counted as follows.
 - If entropy_coding_mode_flag is equal to 0, the number of bits of macroblock_layer() data is given by the number of bits in the macroblock_layer() syntax structure for a macroblock.
 - Otherwise (entropy_coding_mode_flag is equal to 1), the number of bits of macroblock_layer() data for a macroblock is given by the number of times read_bits(1) is called in subclauses 9.3.3.2.2 and 9.3.3.2.3 when parsing the macroblock_layer() associated with the macroblock.

Table A-1 specifies the limits for each level. Entries marked "-" in Table A-1 denote the absence of a corresponding limit.

A level to which the bitstream conforms shall be indicated by the syntax element level_idc as follows.

- If level_idc is equal to 9, the indicated level is level 1b.
- Otherwise (level_idc is not equal to 9), level_idc shall be set equal to a value of ten times the level number specified in Table A-1.

A.3.3 Profile-specific level limits

- a) In bitstreams conforming to the Main, High, High 10, High 4:2:2, or High 4:4:4 profiles, the removal time of access unit 0 shall satisfy the constraint that the number of slices in picture 0 is less than or equal to $(\text{PicSizeInMbs} + \text{MaxMBPS} * (\text{t}_r(0) - \text{t}_{r,n}(0))) \div \text{SliceRate}$, where SliceRate is the value specified in Table A-4 that applies to picture 0.
- b) In bitstreams conforming to the Main, High, High 10, High 4:2:2, or High 4:4:4 profiles, the difference between consecutive removal time of access units n and n - 1 (with $n > 0$) shall satisfy the constraint that the number of slices in picture n is less than or equal to $\text{MaxMBPS} * (\text{t}_r(n) - \text{t}_r(n - 1)) \div \text{SliceRate}$, where SliceRate is the value specified in Table A-4 that applies to picture n.
- c) In bitstreams conforming to the Main, High, High 10, High 4:2:2, or High 4:4:4 profiles, sequence parameter sets shall have direct_8x8_inference_flag equal to 1 for the levels specified in Table A-4.
NOTE – direct_8x8_inference_flag is not relevant to the Baseline profile as it does not allow B slice types (specified in subclause A.2.1), and direct_8x8_inference_flag is equal to 1 for all levels of the Extended profile (specified in subclause A.2.3).
- d) In bitstreams conforming to the Main, High, High 10, High 4:2:2, or High 4:4:4 or Extended profiles, sequence parameter sets shall have frame_mbs_only_flag equal to 1 for the levels specified in Table A-4 for the Main, High, High 10, High 4:2:2, and High 4:4:4 profiles and in Table A-5 for the Extended profile.
NOTE – frame_mbs_only_flag is equal to 1 for all levels of the Baseline profile (specified in subclause A.2.1).

- e) In bitstreams conforming to the Main, High, High 10, High 4:2:2, or High 4:4:4 or Extended profiles, the value of `sub_mb_type` in B macroblocks shall not be equal to `B_Bi_8x4`, `B_Bi_4x8`, or `B_Bi_4x4` for the levels in which `MinLumaBiPredSize` is shown as 8x8 in Table A-4 for the Main, High, High 10, High 4:2:2, and High 4:4:4 profiles and in Table A-5 for the Extended profile.
- f) In bitstreams conforming to the Baseline and Extended profiles, $(xInt_{max} - xInt_{min} + 6) * (yInt_{max} - yInt_{min} + 6) \leq \text{MaxSubMbRectSize}$ in macroblocks coded with `mb_type` equal to `P_8x8`, `P_8x8ref0` or `B_8x8` for all invocations of the process specified in subclause 8.4.2.2.1 used to generate the predicted luma sample array for a single reference picture list (reference picture list 0 or reference picture list 1) for each 8x8 sub-macroblock, where `NumSubMbPart(sub_mb_type) > 1`, where `MaxSubMbRectSize` is specified in Table A-3 for the Baseline profile and in Table A-5 for the Extended profile and
- `xIntmin` is the minimum value of `xIntL` among all luma sample predictions for the sub-macroblock
 - `xIntmax` is the maximum value of `xIntL` among all luma sample predictions for the sub-macroblock
 - `yIntmin` is the minimum value of `yIntL` among all luma sample predictions for the sub-macroblock
 - `yIntmax` is the maximum value of `yIntL` among all luma sample predictions for the sub-macroblock
- g) In bitstreams conforming to the High, High 10, High 4:2:2, or High 4:4:4 profile, for the VCL HRD parameters, `BitRate[ SchedSelIdx ] ≤ cpbBrVclFactor * MaxBR` and `CpbSize[ SchedSelIdx ] ≤ cpbBrVclFactor * MaxCPB` for at least one value of `SchedSelIdx`, where `cpbBrVclFactor` is specified in Table A-2, `BitRate[ SchedSelIdx ]` is specified by Equation E-37 and `CpbSize[ SchedSelIdx ]` is specified by Equation E-38 when `vcl_hrd_parameters_present_flag` is equal to 1. `MaxBR` and `MaxCPB` are specified in Table A-1 in units of `cpbBrVclFactor` bits/s and `cpbBrVclFactor` bits, respectively. The bitstream shall satisfy these conditions for at least one value of `SchedSelIdx` in the range 0 to `cpb_cnt_minus1`, inclusive.
- h) In bitstreams conforming to the High, High 10, High 4:2:2, or High 4:4:4 profile, for the NAL HRD parameters, `BitRate[ SchedSelIdx ] ≤ cpbBrNalFactor * MaxBR` and `CpbSize[ SchedSelIdx ] ≤ cpbBrNalFactor * MaxCPB` for at least one value of `SchedSelIdx`, where `cpbBrNalFactor` is specified in Table A-2, `BitRate[ SchedSelIdx ]` is specified by Equation E-37 and `CpbSize[ SchedSelIdx ]` is specified by Equation E-38 when `nal_hrd_parameters_present_flag` equal to 1. `MaxBR` and `MaxCPB` are specified in Table A-1 in units of `cpbBrNalFactor` bits/s and `cpbBrNalFactor` bits, respectively. The bitstream shall satisfy these conditions for at least one value of `SchedSelIdx` in the range 0 to `cpb_cnt_minus1`.

Table A-2 – Specification of `cpbBrVclFactor` and `cpbBrNalFactor`

Profile	<code>cpbBrVclFactor</code>	<code>cpbBrNalFactor</code>
High	1 250	1 500
High 10	3 000	3 600
High 4:2:2	4 000	4 800
High 4:4:4	4 000	4 800

A.3.3.1 Baseline profile limits

Table A-3 specifies limits for each level that are specific to bitstreams conforming to the Baseline profile. Entries marked "-" in Table A-3 denote the absence of a corresponding limit.

Table A-3 – Baseline profile level limits

Level number	MaxSubMbRectSize
1	576
1b	576
1.1	576
