

Specification for O-Ring Face Seal Connectors: Part 3—Requirements, Dimensions, and Tests for Steel Unions, Bulkheads, Swivels, Braze Sleeves, Connectors, Caps, and Connectors with SAE J1926-2 Inch Stud Ends

RATIONALE

Not applicable.

FOREWORD

The JUN2002 edition of SAE J1453 was published as a single document covering the requirements for Inch O-ring face seal connectors with SAE J1926-2 inch stud ends. In 1995 ISO 8434-3 was published covering the requirements for O-ring face seal connectors to ISO 6149-2 metric stud ends. This revision of SAE J1453 adopts the parts covered within ISO 8434-3 and the rationalized dimensions from ISO 8434-3 for both the inch and metric stud end face seal connectors. SAE J1453 has been organized into three sections as follows:

1. SAE J1453-1—Specifications for O-ring Face Seal Connectors: Part 1—Tube Connection Details and Common Requirements for Performance and Test
2. SAE J1453-2—Specifications for O-ring Face Seal Connectors: Part 2—Requirements, Dimensions and Tests for Steel Unions, Bulkheads, Swivels, Braze Sleeve Connectors, Caps, and Connectors with ISO 6149-2 Metric Stud Ends
3. SAE J1453-3—Specifications for O-ring Face Seal Connectors: Part 3—Requirements, Dimensions and Tests for Steel Unions, Bulkheads, Swivels, Braze Sleeve Connectors, Caps, and Connectors with SAE J1926-2, Inch Stud Ends

SAE J1453-2 parts are technically equivalent to ISO 8434-3 parts; SAE J1453-3 parts are technically equivalent to SAE J1453 JUN2002 parts, with this exception this edition includes the half-dovetail as the standard groove design. Parts supplied to SAE J1453 JUN2002 shall now be supplied to SAE J1453-3.

A typical O-ring face seal connection is shown in Figure 1, and typical tube and hose connections are shown in Figure 2.

1. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal OD) or inside diameter of the hose (nominal hose ID).

For example: -4 = 4/16 = 0.25 = 6.35 mm inch tube size or hose, or corresponding port.

2. See SAE J1453-1 for Screw Thread information.

3. Torque values listed in Table 1 are for controlled testing to establish compliance to the performance requirements set forth in Part 3. Recommended assembly torques by manufacturers may vary from those shown in Part 3.

4. This covers unions, caps, bulkheads and swivels, and plugs.

5. For -4 only, adjustable torque is given. For nonadjustable torque is 35 N.m.

1. SCOPE

1.1 Purpose

The three parts of SAE J1453 cover material, dimensional, and performance requirements of steel O-ring face seal (ORFS) connectors for tubing and the O-ring face seal interface and nut portion of hose stem assemblies for nominal tube diameters of 6 mm through 38 mm and for nominal hose diameters 6.3 mm through 38 mm. SAE J1453-3 covers the requirements for "inch based" O-ring face seal connectors to inch stud ends along with the associated adapters, bulkhead and union connectors. Inch hex wrenching flats are predominantly used throughout this standard.

1.2 Field of Application

These connectors are intended for general application (see Figures 3, 4, and 5) and hydraulic systems on industrial equipment and commercial products, where elastomeric seals are acceptable to overcome leakage and variations in assembly procedures. These connectors are capable of providing leak proof full flow connections in hydraulic systems operating from 95 kPa vacuum to working pressures shown in Table 4. Since many factors influence the pressure at which a hydraulic system will or will not perform satisfactorily, these values should not be construed as guaranteed minimums. For any application, it is recommended that sufficient testing be conducted and reviewed by both the user and manufacturer to ensure that required performance levels are met.

For use of these connectors in conditions outside the pressure and temperature limits specified, the manufacturers must be consulted.

Both metric and inch tubing can be accommodated by changing only the sleeve to match the tube diameters. In the past, these connectors have been used predominantly with inch tubing. For new designs metric tubing should be considered.

3. DEFINITIONS

For this part of SAE J1453, the definitions given in ISO 5598 and the following shall apply:

3.1 Fluid Power

(From ISO 5598) Means whereby energy is transmitted, controlled and distributed using a pressurized fluid as the medium.

3.2 Connector

(From ISO 5598) Leakproof device to connect pipelines (conductors) to one another, or to equipment.

3.3 Fastening Thread

Terminal thread of a complete connector.

3.4 Run

Two principal, axially aligned outlets of a tee or cross. See Figure 6.

FIGURE 6 - ILLUSTRATION OF TEE CONNECTOR
SHOWING RUN AND BRANCH

3.5 Branch

Side outlet(s) of a tee, or cross. See Figure 6.

3.6 Chamfer

Removal of a conical portion at the entrance of a thread to assist assembly and prevent damage to the start of the thread.

3.7 Torques

3.7.1 Assembly Torque

The torque to be applied in order to achieve a satisfactory final assembly.

3.7.2 Qualification Test Torque

The torque used to verify conformance of the connector to the requirements of this document.

3.7.3 Over Torque

The torque the nut shall withstand without deformation that renders it unusable.

3.8 Working Pressure

Pressure at which the apparatus is being operated in a given application as shown in SAE J1453-2 and SAE J1453-3. (From ISO 5598)

3.9 Adjustable Stud End

A stud end connector that allows for connector orientation before final tightening of the locknut to complete the connection. This type of stud end is typically used on shaped connectors (e.g., tees, crosses and elbows).

3.10 Nonadjustable Stud End

A stud end connector that does not require specific orientation before final tightening of the connection because it is only used on straight connectors.

3.11 Preferred

Commonly used readily available parts.

3.12 Nonpreferred

Parts which are low volume, considered specials and their use requires special consideration. Dimensions for nonpreferred parts are given to provide standardization within the industry.

3.13 Jump Size Connector

Connectors with unpaired end connections, for example, M14 stud end with 12 mm tube end.

4. REQUIREMENTS

4.1 General

All connectors shall meet or exceed the requirements outlined in SAE J1453-1.

4.2 Dimensional Specifications

Connectors shall conform to their respective dimensional specifications listed for each style of connector. Dimensions specified apply to finished part. Tolerances on all untoleranced dimensions are ± 0.4 mm.

For jump size connectors, the larger end is considered standard and is the basis for dimensions and tolerances (overall, end to center, stock size, etc.). The tolerance on centerline to end of nonstandard shaped connectors shall be ± 1.5 mm. See SAE J1453-3 Appendix on how to calculate jump size connectors.

For jump connectors, at manufacturer's option the drill through passages in straights and in run ends of tees and crosses of special size connectors may conform to the smaller diameter specified, or the appropriate end may be counterbored to the larger diameter up to the middle of the hex for straight connectors and just past the drill of the branch end for tees and crosses.

4.3 Stud End Dimensions

Stud ends shall be in accordance with SAE J1926-2.

4.4 Across Flats

The across flat dimensions of elbows, tees, bulkhead, and swivel connectors given in this standard are intended to be for nominal wrench sizes with minus tolerance only. Tolerances for across flats dimensions for forgings shall be $+0/-0.8$ mm for sizes up to and including 25.4 mm and $+0/-1$ mm for sizes larger than 25.4 mm. The basic forging size may be increased up to the maximum size shown for barstock, but the size selected shall be a nominal inch wrench size across flats with minus tolerance only. For optional metric stock sizes, see Appendix D.

4.5 Hex Tolerances Across Flats

Hex tolerances across flats are listed in Table 3. Minimum across corner hex dimensions are 1.092 times the nominal width across flats. The minimum side flat is 0.43 times the nominal width across flats. See Figure 7.

FIGURE 7 - HEX DETAILS

TABLE 3 - DIMENSIONS FOR HEX TOLERANCES

Units in millimeters (mm)		
Nominal Hex Size Across Flats	Nominal Hex Size Across Flats	Tolerance (Minus Only)
Over	Inclusive	
—	19.05	0.3
19.05	25.40	0.4
25.40	34.92	0.5
34.92	and up	0.8

4.6 Hex Chamfer

See SAE J1453-1.

4.7 Screw Threads

The screw threads on the stud end and face seal end shall be inch (UN/UNF/UNS) per ASME B1.1, See SAE J1453-1 Screw Thread Requirements.

4.8 Working Pressure

The connectors shall meet or exceed the working pressure shown in Table 4.

TABLE 4 - WORKING PRESSURES FOR O-RING FACE SEAL CONNECTORS

Inch Tube OD ⁽¹⁾ Dash Size	Inch Tube OD mm	Nominal Metric OD mm	Connector Working Pressure ⁽²⁾⁽³⁾⁽⁴⁾ Face Seal and Nonadjustable Stud End MPa	Connector Working ⁽²⁾⁽⁴⁾ Pressures Adjustable Stud End MPa
- 4	6.35	6	63	41.3
- 5	7.94	8	63	41.3
- 6	9.52	10	63	41.3
- 8	12.70	12	63	41.3
-10	15.88	16	41.3	41.3
-12	19.05	20	41.3	41.3
-14	22.22	22	41.3	38.0
-16	25.40	25	41.3	34.5
-20	31.75	30	27.5	27.5
-24	38.10	38	27.5	20.7

1. Metric tubing shall be considered. See ISO 10763 for sizes.
2. These pressures were established using connectors made of low carbon steel and tested according to SAE J1644.
3. This includes unions, bulkheads, plugs, swivels, and caps.
4. 1 bar = 10^5 N/m² = 10^5 Pa = 0.1 MPa = 14.5 psi. (To convert from MPa to psi, multiply by 145, for example, 63 MPa equals 9135 psi.)

4.9 Tube Sizes

Hydraulic tubes used with O-ring face seal connectors shall meet the size requirements shown in Table 5. Carbon steel inch tubes shall comply with SAE J356, J524, or J525. Metric tubes shall comply with ISO 3304 or ISO 3305.

TABLE 5 - INCH AND METRIC TUBE SIZE LIMITS

Units in millimeters (mm)

Inch Tube ⁽¹⁾⁽²⁾ OD Dash Size in	Nominal Inch Tube OD ⁽³⁾	Inch Tube OD ⁽⁴⁾ Minimum	Inch Tube OD ⁽⁴⁾ Maximum	Nominal Metric Tube OD mm	Metric Tube OD Minimum	Metric Tube OD Maximum
- 4	6.35	6.25	6.45	6	5.9	6.1
- 5	7.94	7.84	8.04	8	7.9	8.1
- 6	9.52	9.42	9.62	10	9.9	10.1
- 8	12.70	12.60	12.80	12	11.9	12.1
-10	15.88	15.78	15.98	16	15.9	16.1
-12	19.05	18.95	19.15	20	19.9	20.1
-14	22.22	22.12	22.32	22	21.9	22.1
-16	25.40	25.30	25.50	25	24.9	25.1
-20	31.75	31.60	31.90	30	29.85	30.15
-24	38.10	37.95	38.25	38	37.85	38.15

1. Metric tubing shall be considered. See SAE J1453-1 for sleeve dimensions.
2. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal OD) or inside diameter of the hose (nominal hose ID). For example: -4 = $4/16 = 0.25 = 6.35$ mm inch tube size or hose, or corresponding port.
3. Equivalent dimension in millimeters.
4. SAE J524 may require sizing to meet these limits for brazing.

4.10 Plating

See SAE J1453-1 plating requirements.

4.11 Passage Tolerance

See SAE J1453-1.

4.12 Angular Tolerance

See SAE J1453-1.

5. TEST REQUIREMENTS AND QUALITY PROCEDURES

5.1 Test Requirements

Connectors shall be tested per SAE J1453-1.

5.2 Performance Tests

The connector assembly shall meet or exceed all applicable test pressures shown in Table 6 when tested at the torques shown in Table 7. Connectors shall pass the burst, cyclic endurance (impulse), vacuum and overtorque tests when tested per SAE J1644. Torque values listed in Table 7 are for controlled testing to establish compliance to the performance requirements for face seal connectors. Recommended assembly torques by manufacturer may vary from the torques in Table 7.

5.3 Test Pressures

The connector assembly shall meet or exceed all applicable test pressures shown in Table 6.

NOTE: The performance test should be conducted on each of the following types and sizes of connectors to ensure overall performance of all configurations: Figure 12 (520115), Figure 13 (520110), Figure 14 (520220), Figure 20 (520120), Figure 33 (520221), and Figure 38 (520104).

TABLE 6 - TEST PRESSURES FOR O-RING FACE SEAL CONNECTORS
WITH SAE J1926-2 STUD ENDS

38	-24	38.10	1-7/8-12	370	2-12	200	450

1. See SAE J1453-1 Screw Thread Requirements.

2. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal OD) or inside diameter of the hose (nominal hose ID).
For example: -4 = $4/16 = 0.25 = 6.35$ mm inch tube size or hose, or corresponding port.

3. For -4 nonadjustable use 35 N·m.

6. PACKAGING AND MARKING

6.1 Marking

All connector bodies and tube nuts shall be permanently marked with individual supplier's trademark or code identifier, unless otherwise agreed upon by user and manufacturer.

6.2 Protection

By agreement between purchaser and supplier, the face of the O-ring connectors and threads (both internal and external) must be protected by the manufacturer from nicks and scratches detrimental to their function. All passages must be securely covered to prevent entrance of dirt or other contaminants prior to assembly and for parts distribution, handling, and storage. Paper caps and plugs are not permitted.

6.3 SAE J846 Ordering Designation, Part Identification Number (PIN)

By agreement between the manufacturer and user, the ordering designation from SAE J846 may be used to abbreviate the ordering of O-ring face seal connectors.

6.3.1 Connector Designation Code

Connectors are designated according to SAE J846. The connector designation consists of a basic code symbolizing in sequence the following: (a) the connector type, (b) the connector shape, and (c) the connector connecting ends. Connector basic code example, see Figure 8.

FIGURE 8 - CONNECTOR STYLE DESIGNATION

6.3.2 Style and Material Modifiers

Modifiers are added to the code to provide additional information. A 'M' is inserted after the connector type to indicate a metric hex or wrench flat. Suffixes are to be added to indicate the style and material. (See SAE J846 for more complete information.) An example of a complete code follows, see Figure 9:

* 'A' modifies the basic code

FIGURE 9 - CONNECTOR STYLE AND MATERIAL DESIGNATION

6.3.3 Size Designation

The size is indicated by the nominal outside diameter of the tubing or nominal inside diameter of the hose and the port end size for stud connectors. These are added to the connector designation and modifiers. Example using a dash 12 ORFS to a dash 12 inch O-ring stud end on a straight connector in steel, use the following designation. NOTE: For parts to SAE J1453-3 inch tubing is assumed. The ordering designation follows, see Figure 10 and Table 8 for additional samples:

FIGURE 10 - CONNECTOR STYLE, MATERIAL, AND SIZE DESIGNATION

TABLE 8 - ORDERING CODE EXAMPLES

(See SAE J846 for Complete Details)

	Connector Description	SAE Part Identification Number
a	To order a size 16 standard Style A tube nut (Figure 13) made from carbon (C) steel:	J1453-3 16 520110A C
b	To order a size 16 bulkhead elbow connector (Figure 24) made from carbon (C) steel	J1453-3 16-16 520701 C
c	To order a jump size (16 with a 12 branch) swivel tee connector (Figure 34) made from carbon (C) steel	J1453-3 16-16-12 520433 C
d	To order a O-ring face seal stud elbow with a -12 face seal and -16 stud end per SAE J1926-2 made from carbon steel with 90 durometer Nitrile O-ring on both ends	J1453-3 12-16 520220 CN

7. NOTES

7.1 Assembly Information

The assembly of the connectors with the connecting tubes shall be carried out free from external loads. The manufacturer shall provide assembly instructions for the proper use of the connectors. These instructions shall include at least the following details:

- a. Details relating to material and quality of suitable tube.
- b. Details concerning the preparation of selected tube.
- c. Details concerning the attachment of the braze sleeve and weld nipple to the tube.
- d. Instructions regarding the assembly of the connector, such as number of wrenching turns or assembly torque.
- e. Recommendations regarding the tools to be used for assembly.

NOTE: See SAE J2593.

7.2 Identification Statement

Use the following statement in test reports, catalogues and sales literature when electing to comply with this part of SAE J1453-3:

O-ring face seal connectors conform to SAE J1453-3: Specification for O-ring face seal connectors: Part 3—Requirements, Dimensions, and Tests for Steel Unions, Bulkheads, Swivels, Braze Sleeves, Connectors, Caps, and Connectors with SAE J1926-2, Inch Stud Ends.

7.3 Procurement Information

The following information should be supplied by the purchaser when making an inquiry or placing an order:

- a. Description of connector
- b. Material of connector
- c. Material and size of tube
- d. Fluid to be conveyed
- e. Working pressure
- f. Working temperature

NOTE 1: See SAE J1453-1 for manufacturing dimensions not shown.

a. Identification groove for sleeve with metric tube only, (see SAE J1453-1 Figure 5).

1. The smaller of d₁ or d₂₀ may be used on both ends.

2. See Table D1, Appendix D for optional metric forging sizes as agreed between user and supplier.

3. See SAE J1453-1 for screw thread specifications.

4. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal OD) or inside diameter of the hose (nominal hose ID).
For example: -4 = 4/16 = 0.25 = 6.35 mm inch tube size or hose, or corresponding port

20 - 20	-20	31.95	30x30	30	30.2	1-11/16-12	26 ⁽⁴⁾	24.5	14	38.5	44.45		
20 - 24	-24	38.3	30x38	38	38.2	1-11/16-12	26 ⁽⁴⁾	24.5	14	38.5	50.8		
24 - 16	-16	25.58	38x25	25	25.18	2-12	20.5 ⁽⁴⁾	24.5	14	38.5	53.98		
24 - 20	-20	31.95	38x30	30	30.2	2-12	26 ⁽⁴⁾	24.5	14	38.5	53.98		
24 - 24	-24	38.3	38x38	38	38.2	2-12	32	24.5	14	38.5	53.98		

1. Dimensions given are for silver brazing. Other dimensions may apply for other joining methods.
2. 6x6 means a metric size 6 O-ring face seal end to a 6 mm tube, with an inch hex since the code 5201M04 is for an inch hex part with metric tubing.
3. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal) OD or inside diameter of the hose (nominal hose ID). For example:
-4 = 4/16 = 0.25 = 6.35 mm inch tube size or hose, or corresponding port.
4. d₁ diameter is smaller than the standard through hole passage for this size ORFS end. Accordingly, d₁ may be countersunk (90° angle) or counterbored to a diameter which equals the standard hole passage for the ORFS end. Counterbore depth shall be no greater than to the center of the undercut.

1. The dash size symbol applicable to all tube ends and straight thread O-ring boss ends shall consist of the number of sixteenth inch increments contained in the outside diameter of the tubing (nominal) OD or inside diameter of the hose (nominal hose ID). For example: -4 = 4/16 = 0.25 = 6.35 mm inch tube size or hose, or corresponding port.
2. See SAE J1453-1 Screw Thread Specifications.

APPENDIX A - INSTRUCTIONS AND EXAMPLES FOR CALCULATING THE DIMENSIONS FOR SPECIAL SIZE (JUMP) CONNECTORS

A.1 SCOPE

A.1.1 Purpose

Appendix A explains how to calculate the special size (jump) connector dimensions using the factors in Appendix B. The reduction factors and examples are explained using inch connectors.

A.2 DEFINITIONS

A.2.1 Definitions

For this part of SAE J1453, the definitions given in ISO 5598 and SAE J1453-1 shall apply.

A.2.1.1 Special (Jump) size

A special size (jump) connector is one where the end sizes are not equal, that is they either do not have the same tube size and/or commonly paired (equal) end sizes.

Table A1 list the paired (standard) Port Stud Ends to Face Seal connections for inch and metric stud ends for a given tube or hose ID.

A.2.1.2 Nonpreferred

Parts which are low volume, considered specials or nonstandard and the use of which requires special consideration. Dimensions for nonpreferred connectors are given to provide standardization within the industry. A majority of special size (jump) connectors are nonpreferred and carry a higher cost due to low volumes.

TABLE A1 - STANDARD PART SIZE FOR TUBE AND/OR STUD SIZE CONNECTIONS

Dash Size	Nominal Tube OD or Hose ID			Port Stud Ends		Face Seal
	Inch in	mm	mm	SAE J1926-2 (ISO 11926-2)	ISO 6149-2	ISO 8434-3 SAE J1453

-32	2.000	50.80	50	2-1/2-12	M60X2	

A.3 INSTRUCTIONS ON HOW TO CALCULATE DIMENSIONS ON SPECIAL SIZE CONNECTORS

- A.3.1 Appendix B contains tables with various factors or length dimensions to be used in determining the connector dimensions for special size combination connectors (reduction or enlarging) not contained in SAE J1453-3.
- A.3.2 No factors are given for certain multiple jump (over two jump sizes) connectors. When specifying these jump connectors consult the manufacturer for availability.
- A.3.3 For any nonstandard size connector (a connector where the tube ends are not the same, for example: (6,-6,-4), be it a straight, 45 degrees or 90 degrees elbow, tee or cross, one end is always standard conforming to SAE J1453 dimensions. Considering this to be the largest end of the connector, it may then be used as a basis for establishing the stock size and length (either overall or end to center) for all other parts by subtracting the factors equivalent to the reduction in machining requirements from the appropriate standard lengths. The factors applicable to various end configurations and size reductions tabulated in Appendix B were determined on this basis.

The factors applicable to various end configurations and size reductions tabulated in this appendix were determined on the following basis:

- Length dimensions were derived by maintaining the standard hexagon thickness for straight union connectors, and the standard centerline to start of machining point for shaped connectors as seen in Figures A1 and A2. For straight stud connectors the total width of hex and the identification collar (ring) for the larger sizes is held constant.
- Factors given in Tables B1, B3 and B5 were derived by subtracting the standard machining length required for the smaller end from that required for the larger standard end and rounding the result to the nearest half millimeter.
- The factors given in Tables B2 and B4 were derived by subtracting the standard machining length (minimum full thread length, with thread run out, plus an allowance of 1-1/2 pitches for imperfect thread length) required for the smaller end from the same value required for the larger end and rounding the result to nearest half millimeter (see Figure A1).

A.3.4 Basis for Calculating a Reduced Stud End or a Reduced Tube End for Connectors

FIGURE A1 - STUD END REDUCTION

FIGURE A2 - TUBE END REDUCTION

A.3.5 Drill Passages

At manufacturer's option, drill through passages in straight special size (jump) connectors may conform to the smaller diameter specified for up to two step size differences, or conform to one of the following for any size difference:

- The appropriate end may be countersunk to the larger diameter, or
- The appropriate end may be drilled to the larger diameter up to the middle of the hex.

A.3.6 Tolerances

The following tolerances apply to special size (jump) connectors:

- Overall length of straight connectors = ± 0.8 mm
- Centerline to end on shaped connectors = ± 1.5 mm

A.4 EXAMPLES—JUMP CONNECTOR CALCULATIONS

A.4.1 Straight Thread Connector Short - (520120)

ORFS End > O-ring Stud End - See Figure A3 and Table 14 for standard connector dimensions.

FIGURE A3 - STUD STRAIGHT CONNECTOR WITH REDUCED O-RING STUD END
(520120)
REFER TO TABLE B2

EXAMPLE: -10 ORFS and -8 O-ring stud end - (How factors in Table B2 are used.)

Read length L_9 in Table B2 for -10 = 31.2 mm and read Hex from Table B2 = 26.99 mm.

Note, the hex is determined by the largest end diameter to machine the connector.

Also, note a shoulder is required since the port spotface diameter, 30 mm, is less than the hex size across corners, calculated to be 36.03 mm.

Read L_{39} and d_{26} dimensions from Table B2 for the -8 stud end, $L_{39} = 5.6$ mm, and $d_{26} = 23.9$ mm.

All remaining dimensions conform to the face seal end size for -10 shown in SAE J1453-1 or conform to the stud end standard, SAE J1926-2 for -8.

To calculate L_8 , add the stud end length for -8 found in SAE J1926-2, and provided for reference in Table B2, to L_9 , therefore, $L_8 = 31.2 + 14 = 45.2$ mm. Tolerances for the standard dimensional specifications apply.

NOTE: See Table B2 footnote for long connector jump factors.

A.4.2 Straight Thread Connector Short - (520120)

O-ring Stud End > ORFS End - See Figure A4 and Tables 14 and B1.

FIGURE A4 - STUD STRAIGHT CONNECTOR WITH REDUCED FACE SEAL END (520120)

EXAMPLE: -10 O-ring boss end and -8 O-ring face seal end - (Factors from Table B1)

Read dimensions given for -10 ORFS in Table 14 even though the ORFS end is -8.

-10 is the largest end and the connector (thread size is larger, 7/8-14 versus 13/16-16 for -8 ORFS) will be manufactured from this stock size.

Read dimension L_8 from Table 14 for size 10-10 = 43 mm.

Since the connector has a -8 ORFS end, using Table 14, subtract the factor 2.8 mm from 43 mm, thus the revised $L_8 = 43 - 2.8 = 40.20$ mm, and $L_9 = 27 - 2.8 = 24.2$ mm.

A.4.3 90 Degree Elbow - (520220)

O-ring Face Seal End > O-ring Stud End - See Figure A5 and Tables 12 and B4.

FIGURE A5 - SHAPED FACE SEAL CONNECTOR WITH REDUCED O-RING STUD END (520220)

EXAMPLE: -10 O-ring face seal end and -8 O-ring boss end -

Read dimension for size 10-10 ORFS, $L_{10} = 50.0$ mm from Table 12.

From Table B4 read the reduction factor of 4.3 mm.

Subtract 4.3 mm from 50 mm length, thus the adjusted drop length $L_{10} = 45.70$ mm.

For the adjusted L_{11} length, use Table B4, thus the adjusted $L_{11} = 34 - 4.3 = 29.7$ mm.

All remaining dimensions for the face seal end are per SAE J1453-1, and the stud end dimensions are per SAE J1926-2.

A.4.4 90 Degree Elbow - (520220)

O-ring Stud End > O-ring Face Seal End - See Figure A6 and Tables 12 and B3.

FIGURE A6 - SHAPED FACE SEAL CONNECTOR WITH REDUCED FACE SEAL END (520220)

EXAMPLE: -10 O-ring stud end and -8 O-ring face seal -

The O-ring stud end is the standard end of the connector, and L_{10} and L_{11} come from Table 12.

L_7 dimension must be adjusted since the O-ring face seal is a -8 end.

Read from Table 12 L_7 for size 10-10 = 33.5 mm and read from Table B3 the reduction factor of 2 mm.

Adjusted $L_7 = 33.5 - 2 = 31.5$ mm.

All remaining dimensions for the face seal end are per SAE J1453-1, and the stud end dimensions come from SAE J1926-2.

APPENDIX B - REDUCTION FACTOR TABLES FOR JUMP FITTINGS

B.1 SCOPE

Appendix B provides metric, rounded reduction factors for jump fittings in agreement with ISO 8434-3 and SAE J1453-2. It also includes additional jump factors for non-preferred multiple jumps. These factors are provided for standardization within the industry.

TABLE B1 - REDUCTION FACTORS FOR STRAIGHT CONNECTORS WITH SMALLER
O-RING FACE SEAL END⁽¹⁾

Dimensions in millimeters (mm)
Standard Machining Size (Largest End of Connector)

Dash Size Small ORFS End	Nominal Tube OD Small ORFS End	-5 7.92	-6 9.52	-8 12.70	-10 15.88	-12 19.05	-14 22.22	-16 25.40	-20 31.75	-24 38.10
-4	6.35	0	1	3	5.5	7	7.5	7.5 ⁽³⁾	7.5 ⁽³⁾	7.5 ⁽³⁾
-5	7.92		1	3	5.5	7	7.5	7.5 ⁽³⁾	7.5 ⁽³⁾	7.5 ⁽³⁾
-6	9.52			2	4.5	6	6.5	6.5	6.5 ⁽³⁾	6.5 ⁽³⁾
-8	12.70				2.5	4	4.5	4.5	4.5	4.5 ⁽³⁾
-10	15.88					1.5	2	2	2	2
-12	19.05			SEE NOTE ⁽²⁾			0.5	0.5	0.5	0.5
-14	22.22							0	0	0
-16	25.40								0	0
-20	31.75									0
-24	38.10									0
Minimum Stud Hex		15.88	17.46	22.23	25.4	31.75	34.93	38.1	47.63	53.98
Minimum Union Hex		17.46	19.05	22.23	26.99	31.75	34.90	38.10	44.45	53.98

1. To be used when nominal tube OD of at least one face seal end is smaller than the nominal tube OD or O-ring boss of the other end.
2. No factor required for connector with same end sizes. For stud connectors with O-ring face seal end larger than other end, see Table B2.
3. These jump sizes are not preferred.

NOTES: For any nonstandard size connector, be it a straight, 45 or 90 degree elbow, tee, or cross, one end is always standard. Considering this to be the largest end on the connector, it may then be used as a basis of establishing the stocksize and length (either overall or end to center) for all other ends by deducting the previous factors equivalent to the reduction in machining requirements from the appropriate standard lengths shown for a nonreduction (no jump) connector. See Appendix A for more information on calculating the reduction sizes for connector.
